## PREFACE

The Corps of Engineers' comprehensive study of Chesapeake Bay is being accomplished in three distinct developmental stages or phases. Each of these phases is responsive to one of the following stated objectives of the study program.

1. To assess the existing physical, chemical, biological, economic and environmental conditions of Chesapeake Bay and its related land resources.
2. To project the future water resources needs of Chesapeake Bay to the year 2020.
3. To formulate and recommend solutions to priority problems using the Chesapeake Bay Hydraulic Model.

In response to the first objective of the study, the initial or inventory phase of the program was completed in 1973 and the findings were published in a document titled Chesapeake Bay Existing Conditions Report. Included in this seven-volume report is a description of the existing physical, economic, social, biological and environmental conditions of Chesapeake Bay. This was the first published report that presented a comprehensive survey of the entire Bay Region and treated the Chesapeake Bay as a single entity. Most importantly, the report contains the historical records and basic data required to project the future demands on the Bay and to assess the ability of the resource to meet those demands.

In response to the second objective of the study, the findings of the second or future projections phase of the program are provided in this the Chesapeake Bay Future Conditions Report. The primary focus of this report is the projection of water resources needs to the year 2020 and the identification of the problems and conflicts which would result from the unrestrained growth and use of the Bay's resources. This report, therefore, provides the basic information necessary to proceed into the next or plan formulation phase of the program. It should be emphasized that, by design, this report addresses only the water resources related needs and problems. No attempt has been made to identify or analyze solutions to specific problems. Solutions to priority problems will be evaluated in the third phase of the program and the findings will be published in subsequent reports.

The Chesapeake Bay Future Conditions Report consists of a summary document and 16 supporting appendices. Appendices 1 and 2 are general background documents containing information describing the history and conduct of the study and the manner in which the study was coordinated with the various Federal and State agencies, scientific institutions and the public. Appendices 3 through 15 each contain information on specific water and related land resource uses to include an inventory

of the present status and expected future needs and problems. Appendix 16 focuses on the formulation of the initial testing program for the Chesapeake Bay Hydraulic Model. Included in this appendix is a description of the hydraulic model, a list of problems considered for inclusion in the initial testing program and a detailed description of the selected first year model studies program.

The published volumes of the Chesapeake Bay Future Conditions Report include:

<u>Volume Number</u>	<u>Appendix Number and Title</u>
1	Summary Report
2	1 - Study Organization, Coordination and History 2 - Public Participation and Information
3	3 - Economic and Social Profile
4	4 - Water-Related Land Resources
5	5 - Municipal and Industrial Water Supply 6 - Agricultural Water Supply
6	7 - Water Quality
7	8 - Recreation
8	9 - Navigation 10 - Flood Control 11 - Shoreline Erosion
9	12 - Fish and Wildlife
10	13 - Power 14 - Noxious Weeds
11	15 - Biota
12	16 - Hydraulic Model Testing

## CHAPTER I

### THE STUDY AND THE REPORT

The Chesapeake Bay Study developed through the need for a complete and comprehensive investigation of the use and control of the water resources of the Bay Area. In the first or inventory phase of the study, an assessment was made of the Bay's existing physical, chemical, biological, economic, social, and environmental conditions and problem areas. Set forth in the Existing Conditions Report, this information was used as a common source of reference for the second or future projections phase of the Chesapeake Bay Study Program. The Future Conditions Report, of which this appendix is a part, presents the findings of the second phase of the study. Included are: projections of future water resource needs and problem areas; general means that might best be used to satisfy those needs; and recommendations for future studies and hydraulic model testing. As a result, this report constitutes the next step toward the goal of developing a comprehensive water resource management program for the Chesapeake Bay Region.

Chesapeake Bay serves as a vast natural asset to the surrounding land area. Along with its tributaries, the Bay provides a natural transportation network on which the economic development of the Region has been based, a wide variety of water-oriented recreational opportunities, a source of water supply for both municipalities and industries, and the site for final disposal of waste products. All of the resources provided by the Bay interact with each other in forming the Chesapeake Bay ecosystem. Unfortunately, problems often arise when man's intended use of one resource conflicts with another resource.

↳ This appendix focuses

The "Economic and Social Profile Appendix" will focus on certain socio-economic characteristics of the Chesapeake Bay Region and its people in order to provide a clearer understanding of future water resource needs and problem areas. The socio-economic topics which are addressed in this appendix include: an economic and social history of the Chesapeake Bay Region; population characteristics of its people; a description of the various economic sectors found in the Estuary Area; and economic and demographic projections for the Bay Region. ↗

#### AUTHORITY

The authority for the Chesapeake Bay Study and the construction of the hydraulic model is contained in Section 312 of the River and Harbor Act of 1965, adopted 27 October 1965, which reads as follows:

(a) The Secretary of the Army, acting through the Chief of Engineers, is authorized and directed to make a complete investigation and study of water utilization and control of the Chesapeake Bay Basin, including the waters of the Baltimore Harbor and including, but not limited to, the following: navigation, fisheries, flood control, control of noxious weeds, water pollution, water quality control, beach erosion, and recreation. In order to carry out the purposes of this section, the Secretary, acting through the Chief of Engineers, shall construct, operate, and maintain in the State of Maryland a hydraulic model of the Chesapeake Bay Basin and associated technical center. Such model and center may be utilized, subject to such terms and conditions as the Secretary deems necessary, by any department, agency, or instrumentality of the Federal Government, or of the States of Maryland, Virginia, and Pennsylvania, in connection with any research, investigation, or study being carried on by them of any aspect of the Chesapeake Bay Basin. The study authorized by this section shall be given priority.

(b) There is authorized to be appropriated not to exceed \$6,000,000 to carry out this section.

An additional appropriation for the study was provided in Section 3 of the River Basin Monetary Authorization Act of 1970, adopted 19 June 1970, which reads as follows:

In addition to the previous authorization, the completion of the Chesapeake Bay Basin Comprehensive Study, Maryland, Virginia, and Pennsylvania, authorized by the River and Harbor Act of 1965, is hereby authorized at an estimated cost of \$9,000,000.

As a result of Tropical Storm Agnes, which caused extensive damage in Chesapeake Bay, Public Law 92-607, the Supplemental Appropriation Act of 1973, signed by the President on 31 October 1972, included \$275,000 for additional studies of the impact of the storm on Chesapeake Bay. A report was consequently published in March 1975 entitled "Impact of Tropical Storm Agnes on Chesapeake Bay."

Previously, measures taken to utilize and control the water and land-related resources of the Chesapeake Bay Basin have generally been toward solving individual problems. The Chesapeake Bay Study provides a comprehensive study of the entire Bay Area in order that the most beneficial use be made of the water-related resources. The major objectives of the Study are to:

- a. Assess the existing physical, chemical, biological, economic, and environmental conditions of Chesapeake Bay and its water resources.
- b. Project the future water resources needs of Chesapeake Bay to the year 2020.
- c. Formulate and recommend solutions to priority problems using the hydraulic model.

The Chesapeake Bay Existing Conditions Report, published in 1973, met the first objective of the Study by presenting a detailed inventory of the Chesapeake Bay and its water resources. Divided into a summary and four supporting appendixes, the report presented an overview of the Bay area and the economy; a survey of the Bay's land resources and the Bay's use; and a description of the Bay's life forms and hydrodynamics.

The purpose of the Future Conditions Report is to project the future water resource needs and problem areas of Chesapeake Bay to the year 2020. The report will also include recommendations for future studies and model testing required to develop a comprehensive management program for the Bay.

The basic purpose of this appendix is to provide an insight into both past and present economic and social characteristics of the Bay Region along with projections of future populations, total employment, total personal income, and total earnings. Many of the projections provided in this appendix will act as input to other functional studies and will ultimately prove useful in projecting future needs and problem areas within the Chesapeake Bay Region.

### SCOPE

The scope of the Chesapeake Bay Study and Future Conditions Report includes the multi-disciplinary fields of engineering and the social, physical, and biological sciences. The Study is being coordinated with all Federal, State, and local agencies having an interest in Chesapeake Bay. All conclusions are based on historical information supplied by the preparing agencies having expertise in that field. In addition, the basic assumptions and methodologies are quantified for accuracy in the sensitivity sections. Only general means to satisfy the projected resource needs are presented, as specific recommendations are beyond the scope of the Study.

The "Economic and Social Profile Appendix" has been prepared and reported in four parts. In the "Economic and Social History Chapter" (Chapter II), the Chesapeake Bay Region's development is traced from earliest settlement in 1607 through a discussion of population and technology in the Twentieth Century. United States Census Data were used in the "Population Characteristics Chapter" (Chapter III) to determine population movements, age distribution, educational levels, and employment and income levels in the Chesapeake Bay Region. The detailed economic analysis (Chapter IV "Economic Sectors") includes a survey of such industries (economic sectors) as manufacturing; public administration; agriculture, forestry, and fisheries; construction; mining; wholesale and retail trade; armed forces; transportation, communications, and public utilities; services; and finance, insurance, and real estate. All these sectors are disaggregated, where appropriate, into various components. Manufacturing, for instance, is broken down into electrical machinery, chemicals and allied products, and food and kindred products. In addition, the various economic

sectors are examined on a geographical or subregional basis. For the economic and demographic projections portion of this appendix (Chapter V), two sets of projections are provided for comparison purposes (Series C and Series E). The projection data were obtained from a program of economic measurement, analysis, and projection conducted by the Bureau of Economic Analysis (BEA) of the U.S. Department of Commerce and the Economic Research Service of the U.S. Department of Agriculture. The Series E Projections were derived from more recent economic and demographic data and assume a gradual decline of fertility rates and a reduced level of Defense spending. Thus, for example, population projected by Series E is generally lower than that projected by Series C for a given region. The Series E projections were used for the sensitivity analysis in Chapter V.

It should be noted that the terms "Bay Region" and "Estuary Area" are used interchangeably throughout this appendix. They refer to that group of counties and Standard Metropolitan Statistical Areas (SMSA's) which touch or have a major influence on the Chesapeake Bay. The area, as delineated in Figure 3-1 includes six SMSA's, 35 non-SMSA counties, and four independent cities (besides those included in the SMSA's). Also shown in Figure 3-1 are the six BEA Economic Areas within which the Chesapeake Bay Estuary Area is contained. The economy of the Estuary Area is best understood in light of the relationship to these six BEA Economic Areas. Table 3-1 lists the counties and independent cities within the Estuary Area by SMSA and non-SMSA.

#### SUPPORTING STUDIES

The "Economic and Social Profile Appendix" was prepared by the Baltimore District Office, U.S. Army Corps of Engineers. Much of the input to the appendix was provided by various U.S. Bureau of the Census publications such as:

U.S. Census of Population: 1970, "General Demographic Trends for Metropolitan Areas, 1960 to 1970."

U.S. Census of Population: 1970, "General Population Characteristics."

U.S. Census of Population: 1970, "Number of Inhabitants."

Census of Agriculture: 1969, "Statistics for the States and Counties."

Census of Housing: 1970, "Detailed Housing Characteristics."

Census of Manufactures: 1972, "Area Series."

Census of Manufactures: 1972, "Water Use in Manufacturing."

Census of Wholesale Trade: 1972, "Area Statistics."

Census of Retail Trade: 1972, "Area Statistics."

All of the projections presented in Chapter V of this appendix were obtained from the OBERS program conducted by the Bureau of Economic Analysis (BEA)--formerly the Office of Business Economics (OBE)--of the U. S. Department of Commerce, and the Economic Research Service (ERS) of the U. S. Department of Agriculture. The OBERS program provides a regionaleconomic information system covering the past as well as the future and treating the economic activity of the Nation as a whole.

Appendix A of the Chesapeake Bay Existing Conditions Report, entitled "The People and the Economy", provided background information for this appendix as did a number of the appendixes of the Future Conditions Report.

In addition to the above, there were a number of other government and private publications used in preparation of this appendix. Specific sources of data are listed at the end of each chapter.

## STUDY PARTICIPATION AND COORDINATION

Due to the wide scope, large geographical area, and many resources covered by the Chesapeake Bay Study, data input was required from many sources. Various Federal, State, and local agencies throughout the Bay Region have customarily developed expertise in certain areas of water resource development. Although overall coordination of the study effort was provided by the Corps of Engineers, input from various sources was required in order to obtain the best study coordination and problem identification. Therefore, an Advisory Group and Steering Committee were established. Five Task Groups were also formed to guide preparation of reports on related resource categories. They are:

- 1) Economic Projection Task Group
- 2) Water Quality and Supply, Waste Treatment, and Noxious Weeds Task Group
- 3) Flood Control, Navigation, Erosion, and Fisheries Task Group
- 4) Recreation Task Group
- 5) Fish and Wildlife Coordination Group

Detailed information on the composition of each task group as well as the members of the Advisory Group is presented in the Chesapeake Bay Plan of Study and in Appendix 1, Study Organization, Coordination, and History.

This appendix was prepared under the guidance of the Economic Projection Task Group whose members include: the Bureau of Economic Analysis and the National Marine Fisheries Service of the Department of Commerce, the Economic Research Service of the Department of Agriculture, Department of Housing and Urban Development, Department of Interior, Environmental Protection Agency, Army Corps of Engineers, and the States of Delaware, Maryland, Virginia, Pennsylvania, and the District of Columbia. The task group is involved in studies designed to provide an understanding of the economic base of the Chesapeake Bay Area in terms of its geographic location, its industrial detail, and its strengths and weaknesses.

## CHAPTER II

### AN ECONOMIC AND SOCIAL HISTORY OF THE CHESAPEAKE BAY REGION

#### EARLY SETTLEMENT

The exploration of the Chesapeake Bay Region may have begun as early as the 11th century when the area was probably visited by Thorfinn Karlesefni, a Viking. It is also thought that John Cabot knew of the Bay in 1498 and that Giovanni de Verrazano sailed into the Bay in 1524.

However, the first fully documented exploration and mapping of the Chesapeake Bay Region had to wait until 1608 when Captain John Smith left the colony of Jamestown, in Virginia, and navigated all the way to the head of the Bay. Captain Smith described the Chesapeake Bay Region in his diary as "a country that may have the prerogative over most places known, for large and pleasant navigable rivers, heaven and earth never agreed better to frame a place for man's habitation."

Man's habitation at the time, except for the Jamestown colony, consisted of such Indian tribes as the Assateagues, Nanticokes, Susquehannockes, and Choptanks. They lived in towns twenty to a hundred miles apart, usually located on a river, and consisting of several hundred families. They grew tobacco and corn and harvested oysters, crabs, and finfish from the Bay's waters. The natives, according to Captain Smith, also ran commercial strip mines (possibly producing antimony) which discolored the streams in the area. This became the first documented instance of man-made pollution in the Bay. However, the Indian settlements were so spread out and had

such relatively low population densities that these and other man-caused pollutants were easily taken care of by the Bay's ecosystem.

The Jamestown colony, from which Captain Smith sailed, was founded in 1607 by Captain Christopher Newport with financial backing from the London-based Virginia Company. It became the first permanent English settlement in America. Its location near a malarial swamp, however, was an unfortunate one because of the disease and discomfort which plagued the settlement. Jamestown itself grew slowly; yet in twelve short years, plantations had spread up both sides of the James River as far as the Appomattox River. By 1624, these plantation settlements extended inland to the head of navigation at the Fall Line, close to what is now Richmond.

The early settlers, like Captain Smith, were extremely impressed by the beauty and abundance of the Bay Region. They reported large numbers of waterfowl which blackened the sky, flocks of wild turkeys, and a profusion of shad, sturgeon, and drumfish. Oysters were reported to be as large as 13 inches long and crabs grew to a length of 12 inches.

The original plan for the development of the Virginia colony was to send the upper strata of England's vast pool of unemployed to the colony to work in urban centers producing goods for the English market. The colonists were urged to send back to England lumber, naval stores, wine, skins, fish, and other goods scarce in the mother country. These goods, however, could not be produced in Virginia at a low enough cost to be profitable. After several years of economic stagnation, the colonists, led by John Rolfe, discovered a crop which could be produced profitably in the New World and which enjoyed a large market in England. This crop was tobacco.

Tobacco captured the imagination of the colonists almost overnight. It was planted in every available clearing, including the fort and streets of Jamestown. The use of tobacco was very fashionable among the upper classes of London, who were willing to pay its weight in silver.

The Virginia Company, however, did not share the colonists' enthusiasm for tobacco, agreeing with King James in calling it a "deceivable weed" which served neither for "necessity nor for ornament to the life of man." The Company continued to encourage and invest in the iron, glass, lumber, fisheries, and shipbuilding industries; however, these attempts were almost totally unsuccessful.

In 1622, the Virginia Company was dealt a severe setback when between three and four hundred of the colony's 1,240 inhabitants were killed in a massacre by Indians. Discouraged and in dire financial straits, the Company abandoned its scheme for diversification and was soon after dissolved by action of the Crown.

### THE TOBACCO ERA

Tobacco dominated the economy of the Chesapeake colonies after 1622 for more than two centuries. It was easy to understand the colonists' preoccupation with the crop. Tobacco prices were so high that it was estimated a man could earn five to six times as much cultivating tobacco than in growing grain. Tobacco imports to England from the Bay Region increased from 60,000 pounds in 1622 to 500,000 pounds in 1628 and up to 1,500,000 pounds in 1639.

The Chesapeake Bay's extensive network of natural waterways opened up approximately 10,000 square miles of tidewater land to immediate cultivation. Settlement quickly spread, first along major rivers, then followed smaller tributaries and finally spread up the Bay all the way to the Susquehanna River. Settlement in the upper part of the Bay was stimulated by several treaties with the Indians and by the granting of a charter to Lord Cecilus Calvert for the Maryland province in 1632. A permanent settlement was founded two years later at St. Mary's City on a tributary of the Potomac River. In 1660, approximately 80,000 people lived in the English colonies, two-thirds of these in the Chesapeake Bay Area.

There were several factors which brought these immigrants to the Bay Region. The first factor was the high level of wages which prevailed in the area, especially when compared to those in England's seriously depressed economy. An ordinary laborer could earn four or five times as much growing tobacco in Virginia or Maryland than he could for his services in England. Even highly skilled artisans often abandoned their trades upon reaching the colonies and turned to the cultivation of tobacco.

Another factor which brought many migrants to the Bay Area was the liberal land distribution policies of the Virginia and Maryland governments. Virginia offered 50 acres to any person who could pay his way from Europe. A family of five would receive 250 acres under this system. Lord Baltimore, during the early days of the province, promised 2,000 acres of land to every person who could transport five adult males to Maryland with lesser amounts of land for fewer people.

Many of the people who came to the Bay Area came as servants, either voluntarily or involuntarily. It was estimated that over one-third of the white immigrants to the Chesapeake Bay Region prior to the Revolution, arrived in some form of bondage. During the early period of settlement, the system of indentured servitude provided most of the labor arriving in the colonies. In this system, the planters advanced the passage of money to immigrants who wanted to go to the New World but could not afford the expensive voyage. The newcomer was placed under contract to the planter to work off his debt. The period of servitude usually lasted from four to five years.

In contrast to this "voluntary" form of servitude, many others came to the colonies against their will. Political, religious, and war prisoners were often sent to the colonies as servants. Over 1,600 Scottish prisoners, captured at the Battle of Worcester, were sent to Virginia in 1651. The kidnapping of teenage boys and girls was a profitable undertaking in the streets of London and Bristol. On arrival in the colonies, these coerced workers were placed on auction blocks and sold to the highest bidder.

Despite the efforts of first the Virginia Company and later the British government to establish urban centers in the Bay Area, there was little inclination on the part of these new colonists to settle into towns. In an environment in which each planter could load his crops on ships which could dock almost at his doorstep, towns were simply not needed. "No country is better watered," wrote the Reverend Jones, "for the conveniency of which most houses are built near some landing place; so that anything may be delivered to a gentleman there from London, Bristol, etc., with very little trouble and cost." In addition, the plantation economy discouraged the growth of towns since many urban functions such as cobbling, clothesmaking, buck manufacturing, and repairs could be effectively handled on plantations. The land distribution policies of Maryland and Virginia also tended to keep settlement spread out through the region. It was largely these factors which kept towns such as Williamsburg, Jamestown, St. Mary's, Lancaster, Yorktown, Chestertown, and Cambridge from developing in size and importance. It took another phase of the Bay Region's economic history to bring about development of big cities.

In 1660, the Royal government passed a series of laws, known as the Navigation Acts, which regulated the trade of the colonies. Important colonial products, such as tobacco, were to be sent only to England or English colonies. However, the tobacco production of the Chesapeake colonies had long since outgrown the English market. The Royal government reasoned that Maryland and Virginia would have to cut tobacco production and turn their energies toward manufacturing or suffer the consequences of overproduction. The colonists, for the most part, suffered. Prices fell to half of their previous levels. Planters complained that their returns were so low they could "live but poorly upon it." The Governor and Council of Virginia stated that the "people of Virginia are generally, some few excepted, extremely poor, not being able to provide against the pressing necessities of their families." The small farmer was especially hard hit. The profits which had previously made it possible for the freedman to advance his position dwindled. Instead, most found themselves in debt to English merchants. The laborer who came to the Bay Area after 1660 found conditions in the colony hardly more favorable for his advancement than in England.

Population growth in the Bay colonies slowed considerably after 1660. For example, the population of Virginia increased 200 percent during the 13 years prior to 1662, but increased by only 25 percent during the next 13 year period. Most of the phenomenon was due to the migration of poor freedmen out of the area and into colonies where more favorable economic conditions existed. This outmigration is evidenced by the fact that between 1662 and 1675, 20,000 people came to Virginia from England, but the total population of the colony increased by only 10,000.

Complete disaster in the Bay colonies was averted by two developments. The first was the gradual expansion of the European tobacco market over a period of 40 years. By the end of the 17th century, two-thirds of the Chesapeake crop was annually reexported from England to the Baltic countries as well as Holland, France, Spain, Ireland, and other parts of Europe. The second development was the greatly increased rate of importation of cheap labor in the person of African slaves. Slaves began to pour into the colonies in increasing numbers after the British were able to capture a part of the slave trade from the Dutch in the late 17th century. In 1649, when Virginia's population numbered 15,000, there were only about 300 blacks in that total. During the period from 1699 to 1708, however, over 6,800 slaves arrived in the Virginia colony, a number exceeding the entire importation during the 17th century. The use of slave labor lowered production costs enough to allow the larger planters who could afford slaves to stay in business.

The Navigation Acts, however, were partially successful in stimulating manufacturing in the Bay Region. When the price of tobacco fell so low that the planters were unable to afford necessary supplies from England, there was a spurt of industrial activity in tanning, shoemaking, and in the manufacturing of linen, woolen, and cotton cloth.

The coal and iron industries also experienced some development during the first half of the 18th century. The first coal mine in North America was found along the James River in Chesterfield County, Virginia. Extraction began in 1735 and the area enjoyed a virtual monopoly on the Nation's coal supply for almost a century.

An important pig iron industry was established in the Maryland foothills about this time attracted by the abundant iron ore and fuel located in the area. By mid-18th century, Maryland was producing a quantity approximately equal to one-seventh of the production of England.

#### DIVERSIFICATION OF AGRICULTURE

As tobacco prices continued to fall during the first part of the 18th century, the growing of corn and wheat became increasingly important to the economy of the Chesapeake Bay Region. This was especially true in areas where tobacco had never grown very well, such as the Eastern Shore. It was discovered that these grains would thrive on old tobacco fields which were previously thought as "worn out." The cultivation of grain was further encouraged by the development of grain markets in the West Indies, Southern Europe, and New England, and by the influx of grain-growing Germans into Central Maryland and Virginia. Chestertown and Baltimore, Maryland, along with Norfolk, Virginia, developed into important centers for grain export. Baltimore had been founded in 1729 and made a privileged place for the landing, loading, and selling of goods to insure its success. Its location further inland than Philadelphia and New York, combined with its proximity to water power made it an especially attractive site. The city soon grew at the expense of older ports in the vicinity--took their foreign trade away and began serving as a collection point for commodities for the greater part of the Bay Region. By

the beginning of the nineteenth century, Baltimore was the fourth largest port in the United States with industries including flour mills, refineries, distilleries, tobacco factories, rope works, paper and cotton mills, nail and shoe factories, tanneries, and lumber yards.

Since a large part of the West Indies trade was carried on in colonial vessels, the shipbuilding and outfitting industries in the Bay Region were given an important stimulus. Norfolk, Annapolis, Chestertown, and Baltimore constituted the chief shipbuilding centers. The principal center, Norfolk, was advantageously located near the Dismal Swamp which was rich in lumber and naval stores. The town also had a sufficiently deep harbor to accommodate the largest vessels of the period. In addition, Norfolk was located near the mouth of the Bay, making trade easy with Europe and other parts of the world. The large shipping business which developed had a multiplier effect, attracting large numbers of merchants, artisans, ship-owners, captains, and sailors. The Chesapeake Bay Region became a shipbuilding center second only to New England in the American colonies during the half century before the Revolution.

Despite the growth of the shipbuilding and grain industries during the period before the Revolution, tobacco remained the most important product of the Region. Slaves continued to pour into the area to work on the vast plantations. The Census of 1790 showed Maryland and Virginia with approximately 57 percent of all the slaves in the United States.

The continued influx of slaves put an almost complete halt to the importation of white servants and had a disastrous effect on the Bay Region's middle class of small planters and tradesmen. This was especially true in Southern Maryland and in Virginia where the plantation system was well entrenched. Slaves were often taught to be sawyers, carpenters, smiths, and coopers. The use of Negro craftsmen on the plantations tended, by lowering wages and casting a stigma on skilled labor, to run white men out of the trades. The absence of white artisans was acutely felt, for they would have provided a sorely needed element of strength and democracy in a society economically unsound and basically aristocratic. These white skilled workers left the Bay Area in large numbers, usually migrating to one of the surrounding colonies where they could earn a decent living.

The small planter often experienced a similar fate. Unable to compete with the low production costs of the slave-holding plantation owners, many small planters began to raise a higher quality variety of tobacco which required skills the newly

arrived slaves had not yet acquired. This worked fairly well during the first half of the 18th century. As the slaves became more proficient in the cultivation of tobacco, however, this advantage was soon lost. Many small planters joined the tradesmen in leaving the Bay Area.

In short, the economy of the Chesapeake Region, from settlement of Jamestown to the American Revolution, was based almost entirely on the production of tobacco. Some diversification of agriculture took place during the 18th century as well as some minor industrial activity, but both remained relatively unimportant in comparison to tobacco. On the eve of the Revolution, Norfolk, Virginia was considered to be the most important town in the Bay Area. However, there were no major concentrations of population anywhere in the area. Less than 3 percent of the total population was considered urban in 1776. As might be expected in a largely rural environment, there was little economic or social interaction between the colonists. Each plantation had its own, self-contained, economic and social structure. The Bay Area was thus deprived of the cultural and economic advantages of urban communities during the colonial period.

#### POST-REVOLUTIONARY WAR PERIOD

Both the Revolutionary War and the War of 1812 had significant impacts on the Chesapeake Bay Region. Several major battles and many minor skirmishes caused extensive property damage and loss of life in the area. The town of Norfolk was destroyed by the British troops during the Revolution. The tobacco industry was especially hard hit during the two wars as naval blockades by the British effectively cut off the European markets to American trade causing tobacco prices to tumble in this country.

On the other hand, there were several positive developments in the Area during this period. Baltimore enjoyed quite a shipbuilding and outfitting boom during both wars. The town's shipbuilders outfitted the first frigate of the Continental Navy, and the first two cruisers of the United States Navy. During the War of 1812, a fleet of 126 privateers operated out of Baltimore. These 126 accounted for 556 British vessels, or

nearly one-third of the total taken by American vessels of all classes, including the Navy.

Another important development was the establishment of the new National Capital in the District of Columbia, on the Potomac River. The 131 employees of the Departments of State, War, Navy, and the Post Office were moved to their new headquarters in June of 1800.

Probably the most important economic development in the Bay Region during the period after the Revolutionary War was the tremendous growth of the towns along the Fall Line as market and processing centers for the produce of the hinterlands. Settlement had continued to spread westward, moving through the Shenandoah Valley and into the vast, highly fertile Ohio River Valley. Produce from these Western lands moved through the ports along the Mid-Eastern Coast of the United States and then on to the major population centers of the world. The individual rates of growth of these port cities depended on the productivity and extent of hinterland which each controlled.

The Fall Line cities in the Chesapeake Bay Region were, as a whole, ideally located to capture a large part of the Western trade. They were farther west than any of the other major ports on the Eastern Coast of the United States and most were on waterways which could be navigated by ocean-going vessels. They were also ideally situated for the processing of raw materials due to an abundance of swiftly-flowing streams which offered water power for the operation of mills.

### THE CANAL ERA

The City of Richmond, along with the twin towns of Alexandria and Georgetown in the Washington, D. C. area, were well situated to significantly increase the area under their commercial control. They were located on rivers which flowed not only through the fertile Piedmont, but all the way into the Blue Ridge Mountains, close to the Ohio River system. Unfortunately, the Potomac and James Rivers were navigable only by shallow-draft vessels above the Fall Line, and then only during

periods of high water. Around 1785, the towns launched projects to build canals around the falls and to improve the navigability of the rivers above the falls.

The James River project moved along steadily, and by 1800 the river improvements extended all the way to Buchanan, Virginia, 196 miles from Richmond. Political bickering between Maryland and Virginia held up the completion of the Potomac River project until 1823.

Both projects were immediately successful. The cost of moving freight down the river and canal systems was less than half the equivalent cost by wagon. Traffic down the Potomac River tripled the first year after the opening of the Great Falls Canal.

These improvements were not totally satisfactory, however, because the canals were designed for shallow-draft boats and the rivers were still only navigable during times of high flow. In 1823, it was estimated that there were only 45 days in the year on which goods and produce could be borne down the Potomac to Alexandria and Georgetown.

Meanwhile, New York City seemed likely to capture the bulk of the Western trade as the Erie Canal neared completion. Spurred into new action by this threat from New York, the towns made plans to build deep water canals into the hinterlands of the Potomac and James Rivers.

Baltimore originally backed the Chesapeake and Ohio Canal project along the Potomac, planning to construct a feeder canal into the city. However, when this plan was proven to be technically impossible, Baltimore withdrew its support.

The Chesapeake and Ohio and the James River Canal Companies woefully underestimated the expense and time involved in the construction of their canal systems. Still plagued by political controversy, the C & O Canal did not reach its objective, Cumberland, until 1850.

Although these two canals were never able to repay the tremendous amounts of money spent on their construction, they did have important impacts on the local economies. For example, the James River Canal in 1860 still transported three times as much cargo as the busiest railroad line. The main eastward moving cargoes were tobacco, wheat, flour, iron, coal, and limestone products. Westbound boats were loaded with manufactured goods, salt, sugar, coffee, fish, hardware, and fertilizer.

The advent of the Railroad Era in the 1830's was destined to force most of the canal companies out of business. The slowness of barge transportation and the fact that the canals were normally open only nine months a year, due to freezing, made the canals poor competitors to the railroads.

The only really successful canal system built in the Bay Region was the Chesapeake and Delaware Canal which connected the Chesapeake Bay and the Delaware River in the Upper Eastern Shore. Although the project was first proposed in 1661, the construction was not completed until 1829. It shortened the route from Baltimore to Philadelphia by 316 miles, to New York by 179 miles, and to European ports by about 100 miles. The canal is still in operation and it annually handles approximately 22,000 vessels of all types, making it one of the busiest waterways in the world.

### THE RAILROAD ERA

Baltimore was probably fortunate in not being located on a river which reached very far inland. The city did not get caught-up in the canal building craze which swept the East Coast. Instead, the merchants and political leaders of the city studied alternative ways of improving transportation to and from the hinterland. The decision was made to build a railroad into the Ohio Valley. The Baltimore and Ohio Railroad began construction in 1827, becoming one of the first commercial railways in the country. By 1831, the Frederick to Baltimore portion of the line was completed. Wheat from Western Maryland, Pennsylvania, and Northern Virginia farms was readily transported, by rail, to the mills surrounding Baltimore. After milling, the flour was railroaded into the city, down to the waterfront and the waiting ships. In 1835, a branch line was completed to Washington, and in 1842 the B & O reached Cumberland, eight years before the C & O Canal. By the time the railroad had reached the Ohio River in 1852, Baltimore had become one of the major railroad ports in the country. In the Census of 1840, Baltimore was the second largest city in the country, behind New York.

Railroad construction in Virginia was stimulated by competition among Norfolk, Petersburg, and Richmond for control of the

profitable tobacco trade of the Roanoke River Valley, traditionally controlled by Norfolk. Petersburg made a bid during 1830-33 by constructing a rail line to Weldon, North Carolina. The venture was very successful. Richmond attempted to tap this business by building the Richmond and Petersburg Railroad, completed in 1838. Norfolk reentered the competition by constructing a line from Portsmouth to Weldon. Richmond ultimately gained the upper hand during the 1850's with the construction of the Richmond and Danville Railroad to Danville, Virginia, which carried almost as much tobacco during this time as the James River Canal.

Another line which linked Richmond with Charlottesville in 1850, was designed to capture part of the upper Shenandoah Valley trade which was then controlled by Baltimore. This line was later extended to Covington and became the busiest railroad in Virginia.

#### THE PRE-CIVIL WAR ERA

Improvements in transportation stimulated the further development of raw material industries throughout the Bay Region. A wheat boom, starting in the 1820's gave added impetus to the flour-milling business. The wheat farmers were able to realize great increases in productivity with the introduction of new soil conservation practices, first developed in Loudoun County, Virginia. Improvements in plow design and the invention of the mechanical reaper also helped increase productivity. By 1830, Maryland and Virginia were producing over one-half of the wheat raised in North America. Baltimore and Richmond vied for the title of the country's major flour-milling center. During the period 1834-50, Richmond's Gallego Mills were the world's largest.

Tobacco production and processing also continued to increase during this period. Richmond became the Nation's center for the tobacco processing industry. The city alone processed more tobacco than New York, the second-ranking state. One of every eleven Richmonders was employed in the industry. Petersburg's production was about half that of Richmond's. Approximately 90 percent of the production of the two cities was in chewing tobacco.

The use of slave labor spread from the plantations to the factories in Richmond and Petersburg. Some of the slaves were bought by the industrialists. But more often the plantation owners would rent the services of their slaves to the factory owners, especially during the winter months. The cotton-milling industry was expanded in these two cities as a source of employment for white laborers since most whites refused to work next to blacks in the existing factories.

Meanwhile, Baltimore was following a different course of economic and social development. The city's economy became much more diversified after the Revolution, becoming less dependent on tobacco for its well being. Commercial ties were established with the newly-formed South American Republics and China. The port became a major importer of guano from Peru for distribution from Baltimore to Southern plantations for use as a fertilizer. Coffee from Brazil and copper ore from Chile and Peru were also important in the South American trade. In sharp contrast to Richmond and Petersburg, Baltimore did not use slave labor to any significant extent in its factories, thus developing an important middle class of skilled workers.

By 1860, Baltimore was well established as the leading commercial and industrial center in the Bay Area as indicated by the population figures in Table 3-2. Norfolk had not grown as rapidly as the other cities in the region during this period because of its failure to establish strong commercial ties with the hinterland. By 1860, Washington, D.C. was only fourteenth in size but was beginning to show signs of awakening from its 60-year slumber, although United States Senators and Representatives often complained of cows, sheep, and goats roaming through the city's unimproved streets.

The figures in Table 3-2 also reflect the trend toward urbanization during the period between 1790 and 1860. This is especially true in the northern section of the Bay Region. The urban population of Virginia increased approximately 940 percent during this period, while Maryland's city dwellers increased over 1,700 percent. However, the proportion of Virginia's population considered urban remained a relatively low 9.5 percent. In contrast, Maryland's urban dwellers comprised about 34.0 percent of the total population. The northern part of the Bay Region, and the Baltimore area in particular, was clearly becoming a vital part of the developing commercial-industrial complex along the Northeastern coast of the United States. This was the area which was later to become known as the "megalopolis."

### THE CIVIL WAR YEARS

General William Tecumseh Sherman, who perhaps saw more clearly into the future than any of his contemporaries, wrote at the onset of the Civil War that "in all history no nation of mere agriculturists ever made successful war against a nation of mechanics . . ."(1) This prophecy of Sherman's became self-fulfilling as the War progressed, for business and industrial expansion in the North kept pace with the increasing victories of the Union Army.

The basic outline of industrial development in the North had of course been drawn before 1861: railroad construction, exploitation of vast coal, timber, and other mineral resources, factories and corporations becoming larger and larger in size and influence, mechanization of agriculture and industry, and so forth; however, the war between the states gave this whole movement a tremendous push. The need to supply the Union Army with war material, the removal of an obstructionist Congress dominated by Southerners who blocked approvals for internal improvements and tariffs, the money to be made in

waging a war, and the need to replace manpower with mechanical power all contributed to the drive toward industrialization, mechanization, and growth in the North.

Farmers purchased some 250,000 reapers during the War. Sewing machines had just been invented and already some 100,000 people were engaged in making ready to wear clothing. Over 200,000 pounds of wool a year were being consumed by the textile industry. Up to 1863 the Union had been forced to import munitions; from this time onward the Union supplied her own ordnance and even began to export war material to Europe. Philadelphia, alone, erected 57 new factories in 1863. All this activity brought fortunes into being. There were now scores of millionaires in America where a few years before there had been only a handful.

Secession in Baltimore had led to a severe internal political crisis because many of the residents held strong Southern sympathies. After a mob fired upon a Northern regiment passing through the city, Baltimore was occupied by Union forces in April 1861. As a result of the occupation, the city's railroad links with the rest of the country were severed. The Union was thus forced to use the Chesapeake and Delaware Canal at the northern end of the Bay to move troops and supplies to Washington.

"It has often been stated that the existence of the canal in 1861 saved Washington from capture."<sup>(2)</sup> The C & D Canal was employed as a transportation route to bypass Baltimore and ferry ordnance to Annapolis where the material was sent on by rail to Washington. So important was the Canal to the Union war effort that it was placed under military protection at the outbreak of hostilities.

Both politically and strategically, the waterways had a great influence over what took place in the Bay Region during the War. The Potomac River divided the Union from the Confederacy. The Chesapeake Bay isolated Virginia's Eastern Shore and tidewater rivers and streams extended Federal naval power far inland, protecting Washington and threatening Richmond. The waterways severely restricted movement of southern land forces. Yet numerous skirmishes, particularly on the Potomac, either successfully cut-off or threatened to cut-off Washington, D.C.'s commercial shipping and trade.

The relative isolation of Baltimore at first created economic depression. Baltimore businessmen, though, soon wrested enough war contracts from the Lincoln administration to start up industry again. Iron works and mills in and around the city made fortunes supplying the Union Army soon after railroad

lines were reestablished, and the shipbuilding capacity of the city greatly expanded over this period.

The Civil War was having a tremendous effect on the growth of Washington. This city which was previously little more than a sleepy provincial town, now became the command center for the largest armed conflict during the nineteenth century. Washington filled overnight with hundreds of thousands of soldiers and their dependents, runaway slaves, and war speculators and profiteers.

While the cities of the North were enjoying a war induced boom, the cities south of the Potomac were also undergoing change. Richmond with its 38,000 residents in 1860 was the most important city in the South Atlantic region. Her factories played an especially important part in the Confederacy's war effort. The Tredegar Iron Works cast practically all of the cannons and a large portion of the rails used in the South. Shoe and clothing factories were established in Richmond during the war, and the city's mills ground a large share of the total flour produced. Petersburg, south of Richmond, also made a significant contribution to the Confederacy by manufacturing a large quantity of gunpowder.

The Southern war effort, however, was almost always hampered by a lack of an adequate transportation network and a chaotic system of finance. The result was continued breakdowns in production caused by lack of raw materials, and of course, destruction of productive machinery by war itself. Inflation was running rampant, a barrel of flour that cost \$25 in 1861 sold for \$1,000 in 1865. Unable to finance itself, running into shortages, damaged by war, the Southern economy toward the end of hostilities found itself living off its accumulated economic and social surpluses. Moreover, at war's end, large sections of Richmond and Petersburg had been burned down, virtually all of their railroads and bridges were destroyed, and the livestock and crops of the region had been stolen or burned off. "Norfolk, had escaped the complete destruction which had been her lot in the Revolution, but her commerce was at a low ebb, her tributary railways broken, her finances deranged, her streets out of repair, her citizens impoverished." (3)

## RISE OF METROPOLIS

Along with industrialization in the 19th Century came the ascendancy of technology and finance. Ultimately, these factors combined to cause the rise of the modern metropolis. Industry, because of the economies of scale provided by technology, needed several developments outside the working place in order to insure industry's success: a large labor force to supply workers to the factories and to keep wages down, a huge centralized market to consume the goods rapidly produced by assembly line techniques, and the elimination of individual tastes so that products could be standardized. Cities, by concentrating both the labor and product market, cheapening the price of labor, and standardizing tastes, fulfilled industry's needs. Economic historian N.S.B. Gras has aptly described the modern economy as "metropolitan economy" because of the crucial role played by the large cities in organizing production and distribution. (4)

Finance also marched in step with the new technology. Industries and railroads could no longer be capitalized by individuals in this new technological era; projects had to have bank financing for their realization. The Civil War had already straightened out a lot of irrational bank practices, such as the large amount of currency issued by the banks themselves, preparing the banks to move into the new arena of big industries and big cities. Banks in turn had to have large numbers of depositors, and banks themselves added to the concentration by forcing other financial institutions and corporation headquarters to be located near them.

Industrialization and the resultant growth of the metropolis came about, in large part, because of the hinterlands which provided much of industry's raw materials. The hinterlands, on the other hand, relied on the city for its finished products. Although there were some mutual points of interest between the metropolis and the hinterland, between Baltimore, Richmond, and Norfolk and the areas these cities traded with, the overriding point was one of antagonism. (Washington being almost entirely a service-oriented city from its very beginning becomes a slight exception to what follows.) The metropolis is the creditor, the hinterland is the debtor. The former produces manufactured goods and wants high tariffs, the latter producing raw materials desires low tariffs.

The hinterland dependent on the transportation system monopolized by the metropolis requires inexpensive shipping. Cities want to buy raw materials cheaply and sell manufactured goods dearly. Both areas compete for a labor supply. By the last quarter of the nineteenth century all these factors were tipping in favor of the metropolis. Cities, in short, were drawing off the hinterland's capital and labor to the metropolis' aggrandizement.

This struggle finally reached its culmination in the railroad and antitrust regulations of the 1880's and 1890's. The hinterland, ultimately, was the loser; legislation proved ineffective in stopping the growth of industry and metropolis. The city stood supreme by the turn of this century, growth would continue to go unrestrained.

The effect on regional agriculture of this city-rural conflict was to further commercial farming practices. As the railroads and cities expanded and deepened the market and as metropolitan development absorbed more and more farmland, farmers in the area more intensely pursued those lines of production they had a greater advantage in. Jean Gottmann's simple rule of thumb that farmers "will continue to grow more food on less land while the cities grow in size and population"(5) is a good method to assess future agricultural trends in the Bay Region.

At this juncture, it will be wise to mention that industrialization did not supersede mercantilism entirely. Trade still continued to play a very important role in the cities, especially in Baltimore and Norfolk. Very few major cities in the United States are not port cities.

Establishment of a hinterland which could be controlled was a very important development to the port cities of the Chesapeake Bay. For the size of the hinterland was a crucial factor in determining how large the city might grow; the hinterland provided raw materials for export and a market for imported and domestically produced goods.

Baltimore was especially favored in this respect since the city sat near the mouth of the Susquehanna River draining the rich Susquehanna Basin. Baltimore also was near the fertile Great Valley of Pennsylvania and Virginia which led to the Ohio River Basin. When its trade with these areas was challenged by Philadelphia commercial interests with their turnpike and canal construction, Baltimore financiers built the Baltimore and Ohio Railroad into the Ohio Valley.

John B. Garrett, president of the Baltimore and Ohio, recognized the strong connection between the grain producing heartland of America and his home city. After he was elected to the

presidency in 1858, he double-tracked the line into the Middle West and obtained good rail connections with St. Louis and Chicago. "I have always considered Baltimore as a natural outlet of the vast northwestern trade now being developed,"(6) said the rival railroader Jay Cook of the Northern Pacific as if in affirmation of Garrett's move.

Garrett heavily committed his line to the grain export trade, and he "gleefully predicted during 1873 and 1874 that his commitment to farm exports would . . . transform Baltimore into the Liverpool of America."(7) Garrett was also interested in establishing trade links between Baltimore and South America, and this continent played an especially large role in the development of the port of Baltimore.

Baltimore was closer to South America than any other major port in the northeast. The port's locational advantage allowed it to capture most of the trade along South America's eastern coast. Brazil's trade in particular was strongly tied to the port of Baltimore; almost 97% of the port's South American shipments went to Brazil from 1812 to 1893. Brazil in turn supplied coffee, and coffee "was the most permanent, fundamental, and successful element in Baltimore's import trade."(8)

Another important ingredient in the expansion of the port was immigration. North German Lloyd Steamship Company opened a passage between Bremen, Germany, and Baltimore in 1868, and from this time onward most of the German immigrants entering the United States came through Baltimore.

Further to the south, Norfolk was likewise being transformed. Consolidation of many small railroads into what finally became known as the Norfolk and Western Railroad allowed commerce which previously went to Richmond to be channeled toward Norfolk. Products of the Far South, southern Virginia, and, most importantly for the port's long range growth, the coal of Virginia, West Virginia, and Kentucky came to Norfolk in ever increasing volume.

After it reached the Pocahontas coal fields of southwestern Virginia, the Norfolk and Western pushed branch lines up all narrow mountain valleys where coal could be found. This railroad then extended its trackage into the West Virginia and Kentucky coal regions and thereby secured a continuous coal supply for shipment to Norfolk. A great variety of products had caused the port's expansion, but from 1885 to the present coal was the leading item in Norfolk's export trade. Norfolk had achieved its goal of becoming the "Newcastle of America" as Baltimore was striving to become the "Liverpool of America."

The port of Norfolk, by the turn of this century, stood supreme as a regional commercial center. "Norfolk now looked back upon the antebellum days when she was struggling vainly to secure railway connections with the south and west, as an unpleasant, hazy memory. With great railway systems fighting to reach her harbor, with the Fall Line towns eliminated as rival ports, with the products of Virginia, West Virginia, North Carolina, Tennessee, and the Far South pouring into her lap, she realized that the long expected prosperity was at hand."<sup>(9)</sup> The value of exports had increased from \$728,000 in 1871 to \$19.8 million in 1882, a twenty-fold expansion in just a little over ten years.

### THE EXPANDING METROPOLIS

There were certain events taking place in a number of Bay cities which were transforming them into growing, thriving metropolises. For example, after the Civil War, Baltimore, Washington, Richmond, and Norfolk were attracting large numbers of rural and foreign immigrants as shown by the population increases reflected in Table 3-3. Such an influx provided a ready source of labor--a precious commodity for an expanding industrial nation.

---

Richmond	37,910	85,028	224
Norfolk	14,620	46,624	319

---

Another factor was to have a tremendous effect on growth. In 1887, the Maryland Steel Company began building a mill at Sparrows Point, a neck of land jutting out into the Bay east of Baltimore City. Four blast furnaces and other facilities were constructed; and by 1890, Maryland was the ninth largest steel producing state in the country whereas previously she had been thirteenth. The history of Sparrows Point goes back to 1867 when the Pennsylvania Steel Company began producing Bessemer rails at their Steelton, Pennsylvania, mill. Low phosphorus iron ore for the Bessemer process at first came from Pennsylvania and New Jersey, but these deposits were inadequate to meet the increasing demand. Pennsylvania Steel Company in 1882 bought extensive iron ore reserves in Cuba and soon after looked around for a tidewater site to build a mill which would minimize haulage distances between the foreign iron ore and the metallurgical coal of Pennsylvania and West Virginia. The site selected was the Baltimore area. Pennsylvania Steel Company in the meanwhile had reorganized itself as the Maryland Steel Company. (In 1916, Bethlehem Steel Company acquired all the plant and equipment of the former Pennsylvania Steel Company.)

The Civil War, so devastating to the South, was to ultimately benefit the Region in certain respects. The war-caused poverty was proving attractive to outside industrial investments. The Philadelphia Telegraph pointed out to its readers that in the South "land, labor, fuel, water power, and building facilities were cheap. The way to clear and large profits is open." (10) Railroads were among the first recipients of northern and foreign capital, some \$150 million being invested in southern railways from 1879 to 1881. The Richmond and Danville Railroad, once a small line, now spurred on by northern capital had, by consolidating smaller lines, 3,125 miles of trackage in 1890. The Richmond and Danville was in turn controlled by the Richmond and West Point Terminal Company which in 1890 had 8,558 miles of tracks. A portion of northern capital also went into the cotton textile industry. Northern investors were exporting technologies into the South which had entered into a decline in the North. Cotton textiles had previously been New England's leading industry, textiles would now hold that position in many areas of the South.

Southern railroad and manufacturing expansion, as noted, was chiefly sponsored and financed by northern and foreign interests. Seventeen Terminal Company directors, for example, out of a total of twenty were northerners. Economic development, however, was not entirely induced from the outside, for a newly emerging, entrepreneurial southern middle-class was coming to the fore. "They are taking the leading place not only in our political and financial affairs, but are pressing to the

front for social recognition" reported the Richmond Whig and Advertiser on April 4, 1876 . . . "Our provincial characteristics are fast disappearing . . . We are no longer a village but a city."(11)

Tobacco processing had a long history of development in Virginia and its capital city. Previously the trade had been carried out largely on a handicraft basis, but by the end of the 19th century it was so mechanized that the Census of Manufacturers would state in 1900 that "everything from the stemming of the leaf to the payment of wages to the employees of the factory is done by machinery." Cigarette smoking was becoming popular at this time, U.S. cigarette production having increased from 20 million in 1870 to 3 billion in 1890. A young Virginian in the meanwhile patented a cigarette making machine in 1880 making it possible for the industry to meet rising demand. Other patents for packaging and labeling machinery, by southerners, were soon forthcoming.

Urban areas were indeed undergoing rapid change. The living conditions were changing as well. Unfortunately, the guiding philosophy by which the expanding cities were sometimes laid out was mechanistic or utilitarian. Social and physiological requirements of people were, in some cases, almost entirely forgotten or disregarded. The thoughtful and imaginative planning of the early planners-architects-engineers was destroyed in the modern era. Only vestiges of their concepts can still be seen today in the original parts of the Bay cities.

Ironically, the order and harmony sought through the scientific and mathematical detachment of the utilitarians led in many cases to human and environmental chaos. For much urban growth was to be planless.

Along the shoreline of Baltimore and Norfolk and the river front of Richmond and the other cities of the Bay (Washington being an exception to a degree) large factories and their accompanying railroad lines, marshalling yards, and slums grew. Factories preempted development along the cities' shoreline or flood plain because this area contained flat, broad expanses of land, railroad lines, and an ample supply of water which industry needed for cooling, cleaning, and processing purposes. "Above all the river . . . had still another important function; it was the cheapest and most convenient dumping ground for all soluble or suspendible forms of waste. The transformation of the rivers into open sewers was a characteristic feat of the new economy. Result: poisoning of aquatic life; destruction of food; befouling of water so it was unfit to bathe in."(12) Some of the Bay tributaries became increasingly polluted from the factories located along the shore.

Intensifying the problem was the urban pattern that the factories created. When population and industry were dispersed in a nascent industrial society, the purifying effects of air and water could remove most of the pollutants caused by people and factories. Concentration overtaxed the ability of the elements to cleanse the environment, and pollution became a major ingredient of urban life.

There were, of course, great improvements in city services. The abuses of industrialization called into being groups which tried to correct some of the most glaring errors. People turned to a system of "municipal socialism" to improve the sanitary facilities of the cities. Sewage mains and treatment plants, aqueducts, pumping stations, and so forth were extended and improved. The effects of these municipally owned facilities were often immediate and direct. In Norfolk, for instance, "a contagious disease hospital was established, war was declared on mosquitoes and flies, school children were inspected regularly, dental clinics were established." (13) The appalling high infant mortality rate, for one, began to level off and decline.

#### THE BAY REGION IN THE TWENTIETH CENTURY

In 1900, half the population of the Chesapeake Bay Region was urban. Urbanization was still more pronounced in the northern portion of the Region than within the area below the Potomac. By the eve of World War II, two-thirds of the entire Chesapeake Bay Region's population was urbanized, and every subregion had at least half its inhabitants residing in cities. The Baltimore Subregion which previously contained 50% of the entire Region's population, in 1940 contained some 40% of the total. The Washington Subregion whose population doubled from 1900 to 1940 experienced the largest absolute change, but the cities south of the Potomac had undergone the greatest relative population growth. The first four decades of the twentieth century were a period of city building in the South, and fueling this expansion was the highest sectional birth rate in the country.

This enormous population pressure on available rural resources, which were not large to begin with, either forced millions out of the South entirely or into the cities of the South. "Over the whole area," W. J. Cash writes of southern city

construction, "hung the incessant machine-gun rattle of riveting hammers; in many places the streets were like those of a rebuilding war area, with the yawning walls of old buildings coming down and of new buildings going up; for solid miles through Dixie the old fashionable residential districts of the years from 1880 to 1920 were being riddled by office buildings, store fronts, filling stations and the like . . ."(14)

Richmond and Norfolk Subregions which had been 35% and 32% urbanized, respectively, in 1900 were by 1940 51% and 59% urbanized. The causes of urbanization below the Potomac were quite different from the causes which lead to city building above the river. Washington, of course, grew in direct relation to the increasing role of the Federal Government. Baltimore's growth coincided with the expanding size of its manufacturing and port activities. Richmond and Norfolk also had manufacturing industries, but in these cities, services, government and especially the military in the Norfolk area created the employment opportunities. Table 3-4 below shows the amount of value added by manufacturing in 1927 by the cities of Baltimore, Richmond, and Norfolk; clearly, the preponderance of manufacturing was still above the Potomac.

---

TABLE 3-4  
VALUE ADDED BY MANUFACTURING

<u>City</u>	<u>Value Added by Manufacturing, 1927 (in millions of dollars)</u>
Baltimore	\$619
Richmond	220
Norfolk	29

The cities below the Potomac in a sense "leap-frogged economic development. They moved into the services, government, and military sectors before the industrial sector had fully developed itself. Services and government would later play a significant role in the Baltimore job market, but the cities below the Potomac, and of course Washington, arrived at this point first. The military, moreover, in the past twenty-five years of war and preparation for war would spur on the urban economy. "In the Norfolk-Portsmouth area, 53% of the income received by

individuals is derived from Federal Government employment. This is a higher proportion than for any large metropolitan area in the country."(15) A significant portion of this income in Norfolk-Portsmouth comes from working in defense industries.

The percentage distribution of personal earnings by industry for metropolitan areas within the Chesapeake Bay Area is shown in Table 3-5.

Chesapeake Bay's economy as well as the national economy had largely completed the process of city building and industrial development in the time between the two world wars. Industrialization and its effects were neither sudden nor dramatic. An incubation period was first needed before a labor force familiar with the seasonal pace of agriculture would submit to the discipline, regimentation, and the very changes in life style demanded by industry. Industrialization, writes Ellul, "resulted not from the exploitation of coal, but rather from a change of attitude on the part of the whole civilization."(16)

#### POPULATION AND TECHNOLOGY IN THE TWENTIETH CENTURY

The Chesapeake Bay Region's population and economy is today still very much urban based. Most economic activity and the majority of people reside within metropolitan areas. In 1969, \$28.3 billion of total personal income accrued to all Bay residents, \$26.1 billion of which went to SMSA dwellers. The current Study Area population totals approximately 7.9 million, of which 7 million live in an urban environment. The Wilmington SMSA has 0.5 million, Baltimore 2 million, 3 million in Washington, another 0.5 million in Richmond, and in Hampton Roads (Newport News-Hampton and Norfolk-Portsmouth) reside 1 million. The rest of the population, 0.9 million, is thinly scattered over the Eastern Shore and on the large peninsulas of the Western Shore. Population and the economy are overwhelmingly urban; yet, over one hundred years ago, these sectors were rural in character. This relatively swift transformation of the Region, and the Nation, constitutes one of the greatest records of city building in history.

<sup>1</sup>Source: U.S. Water Resources Council. 1972 OBERS Projections of Economic Activity in the U.S., Series E, Vol. 5, 1974.

The U.S. and Chesapeake Bay Region labor force underwent significant change in composition during this century as it had over the last. About 70% of the jobs which are held today did not even exist fifty years ago; 70% of the jobs that existed in 1900 have since been eliminated. To call what has happened a "job revolution" or "post-industrial" era as the nation and region shifted from the production of goods to the creation of services, from "blue" to "white" collar, is somewhat premature. Industrial employment (construction, manufacturing, public utilities, transportation, and communications) has remained fairly stable over the past 70 years. What did occur in the period from 1900 to 1970 was a sharp loss in agricultural jobs and a rise in service employment which radically altered the labor structure.

In 1900, employment was more or less balanced between the three employment sectors: agriculture, industry, and services. Seventy years later approximately two out of every three jobs were accounted for by services, and regionally, the service employment share is even higher than nationally. Agriculture in the meantime has almost disappeared as a significant employer. Why these differences between agriculture, industry, and service employment--the declines in the first, the steadiness of the second, and the increases of the last sector? Both industry and agriculture, for example, were shaped by the same technical forces of mechanization and automation. Then why were jobs eliminated on the farm but not in industry? Demand schedules provide part of the answer. That is, while population and real income increased over the last seven decades, the demand for agricultural products did not go up proportionally. Grain tonnage hardly doubled in this century, but population almost tripled and real per capita income rose five times.

The opposite was true for manufactured articles. Sales of automobiles, homes, factories, and so forth more than doubled, tripled, and quadrupled since 1900. Individuals, businesses, and government chose to spend their incomes on consumer durables and non-durables, capital goods, and social overhead rather than for more food and fiber. Per capita calorie intake has, in fact, fallen since 1900 and so has the use of natural fibers.

Secondly, agriculture was and is a much more productive sector than industry. Industrialization itself was dependent upon a rise in output from the land. Even in the modern era, from 1947 to 1970, output per man hour in agriculture increased by 287% as compared to 97% for manufacturing. The use of machinery on the farm resulted in a huge job loss. From 1900 to 1970, agricultural employment, as a percentage of total

employment, fell by 34%, industry only declined by 3%, and these decreases of 37% were shifted to the service sector.

Service employment has come to dominate both the U.S. and Chesapeake Bay Region's labor market. The number of people employed within retail and wholesale trade, finance, insurance, real estate, services, and government in the nation increased by 20.1 million from 1950 to 1970. Over the same period, 5.4 million additional workers (including white collar) entered the construction, manufacturing, utilities, communication, and transportation sector. Government employment both nationally and regionally has been an especially rapidly growing job area. In 1970, over 475,000 people were employed by the public administration sector (government) in the Estuary Area, an increase of over 216 percent since 1940, as shown in Table 3-16. U.S. employment in this sector during the same period increased 183 percent. One out of every seven workers in the Bay Region is currently employed by Federal, State, or local governments as opposed to one in nineteen, nationally.

---

Another factor causing service employment increases has been the transformation of housework. This development, in turn, has lead to the greatest change in the U.S. labor market coequal to that of service employment itself; namely, the entry

of large numbers of women into the labor force. In this century many activities once reserved for the home, and uncoun-  
ted as national income, such as cooking, cleaning, clothes making,  
child rearing, care of the aged, and so on have been assumed  
by the service industry. As a result of the public and private  
sectors performing household tasks, women have been able to  
enter the labor market.

In 1920, women constituted 20% of the total U.S. labor force;  
presently, they make up 40%, and in the near future they will  
probably account for half the total as they already do in the  
Washington, D. C. SMSA.

### GROWTH OF SUBURBS

While the railroad enabled the hinterland to be tapped and  
helped shape the 19th Century city, it was to be automotive  
power which forged the cities in the 20th Century. No longer  
would the size of the city be restricted to that distance which  
could be traveled in about one hour. Cities were spreading  
out and around their peripheries suburbs were being built.

Rising real incomes, deteriorating central city housing, and  
Federal home loans also greatly expanded the suburbs. In  
addition, the invention of alternating current, as opposed to  
Edison's direct current which limited electric transmission of  
from 1 to 2 miles, permitted extension of electric power to  
meet suburban consumer demand. After the streetcar and  
public mass transit's demise in the 1930's, automobiles became  
the favored means of suburban transportation.

Motor vehicles produced 0.1 million horsepower in the U. S. at  
the beginning of the twentieth century. By 1970, this figure  
had increased to 19,325 million horsepower, over half of which  
was employed in moving people from their homes to their jobs.  
The metropolitan regions, as the example in Table 3-7 shows,  
are heavily weighted toward automobile transportation.

In the Baltimore SMSA, 820,000 people go to work each day.  
Of that number, 107,000, or 13%, use public transportation;  
624,000, or 76%, get to their jobs with automobiles. The urban  
pattern that the automobile has established, moreover, espe-  
cially in the suburbs, feeds on and nourishes the car's reason

for being. The isolated shopping center, the isolated industrial park, and the low population density make mobility with one of the least efficient modes of transportation a necessity. There exists the potential, nonetheless, in the Baltimore SMSA and probably within all SMSA's to develop a transportation system which can move commuters cheaply, safely, and swiftly. A system which integrates buses and trains with automobiles will reduce the daily traffic crunch and the accompanying environmental disruption.

Streetcars, public transit, and automobiles gave suburbanites a means of transportation, but it was only in the post-World War II era that suburbs assumed the importance they now have. The war provided employment, forced savings, and price controls which significantly raised real incomes. This in combination with lack of central city housing and Federal subsidies for suburban housing made for sharp increases in suburban populations over the last 30 years. Table 3-8 below shows population growth of the center cities versus that of the SMSA as a whole.

"Two cannons of the new suburbs," writes Boorstin, "were: Romantize and Stratify." (17) Suburbs were frequently laid out to imitate the design of rustic disorder--winding roads, homes set off at irregular distances, and of different designs, split rail fences, plastic farm animals on the lawns, in short, the pastoral ideal in an industrial world, all made possible by a massive intrusion of energy. Stratification meant homogeneous population based on income, religious, and racial composition.

---

After World War II, as noted, the central cities' economies shifted from the production of goods to the creation of services, from blue to white collar. Industry, however, had traditionally been the employer of the unskilled, and with the stagnation of industrial employment, incomes and job opportunities began to drop for urban residents. The second industrial revolution was having a marked effect upon the standard of living of the central cities' population. In Baltimore City, median family income in 1970 was \$8,815. For the five surrounding suburban counties --Anne Arundel, Baltimore, Carroll, Harford, and Howard-- median family income equalled \$11,771. Baltimore central city median family income was only 75% of that found in the suburbs. This represents a 9% drop from the 84% ratio in 1960. Nationally in 1970, the ratio between city and suburb income was 83%.

Virginia's cities and suburbs generally followed the same trend. The cities' population had higher incomes than the surrounding suburban areas before World War II, but in the post-war era, the situation changed.

Although population in the central cities started to decline, people did not move too far out into the hinterland. Economic and social communities were not formed since economic control still remained in the downtown areas of the cities. The jobs, particularly service employment, continued to be found in the cities. Paradoxically much of the manufacturing employment which was started in suburbia is filled by residents of the center cities who because of economic and racial barriers are unable to relocate near their places of work. Thus we have the phenomena of white-collar workers streaming into the city during morning rush hours while blue-collar workers are moving in a counter direction. This situation then reverses itself in the evening.

The rapid expansion of the metropolitan area also affected the surrounding rural area. In the areas between suburbias, the rural parts of Maryland and Virginia, economic development has largely stagnated. Many of these rural communities had more population 100 years ago than they do today. The rural people have, in short, left the farms and migrated to where employment could be obtained, especially the young adults. Whether or not these areas will ever revive is still problematical.

The economic history of the Bay Area is not too unlike that of many other urban areas throughout the world. The developments of man and his accompanying degradations of the environment are a tale told too often in history. It is hoped that this chapter has presented a brief picture of how and why the Bay Area developed and the economic and social framework this water resource must address.

## CHAPTER III

### POPULATION CHARACTERISTICS

#### POPULATION MOVEMENTS

##### HISTORICAL TRENDS

As indicated in the preceding section, the Chesapeake Bay Region was one of the primary growth centers of the New World during Colonial times. However, after the decline of the tobacco industry and the movement westward of many thousands of Americans during the 1800's, population growth in the Region began to lag. It was not until World War II that the Region began, once again, to increase its share of the National population. This can be attributed to a large migration of workers and their families into the Area in response to new employment opportunities induced by greatly increased Federal spending during and after World War II. This was especially true in the Washington, D.C. and Norfolk-Portsmouth, Virginia Subregion. Most of these new jobs were in the Federal government or in Defense-related Manufacturing. For example, Federal employment increased by about 130 percent Nationally between 1940 and 1960 with the Estuary Area experiencing a larger share of this increase. Table 3-9 presents historical population figures for the total Estuary Area and for each Economic Subregion.

The intra-regional movement of people in the Estuary Area during the one hundred years between 1860 and 1960 reflected the National trend toward urbanization. The proportion of the

\*Source: U.S. Census Data

population considered urban (persons living in places with at least 2,500 inhabitants) increased from 39.0 percent in 1860 to 76.8 percent in 1960. These were well above the National figures of 19.8 and 69.9 for the same years. During the period of high growth between 1940 and 1960, the Estuary Area's urban population increased 103 percent, while the rural population gained only 13 percent. The degree of urbanization in a region has a great deal of significance in water resource planning since high levels of demand for water in the cities and high concentrations of wastes from these areas often create water supply and quality problems. Table 3-10 presents historical data for urban and rural populations of the Estuary Area.

### RECENT TRENDS

The population of the Chesapeake Bay Estuary Area increased 23.2 percent during the 1960-1970 decade. This was significantly higher than the National rate of 13.3 percent and higher than 43 of the 50 states. The great majority of the population increase in the Estuary Area, in absolute terms, occurred in the Washington, D.C. Subregion. Approximately 56 percent of the total growth in the Area took place in this Subregion, although only 39 percent of the people in the Bay Region resided there. The Baltimore, Maryland Subregion ranked second in absolute population increase during the decade, despite the fact that its growth rate of 13.5 percent was only slightly higher than the National rate. The Baltimore area benefited from some population "spillover" from the Washington, D.C. Subregion, especially in Howard and Anne Arundel Counties.

Population changes on the county level during the 1960-1970 decade varied greatly. In general, people tended to move out of the inner cities and rural counties and into the suburban counties. Figure 3-2 illustrates percentage change in population by county for the 1960-1970 decade. Most of the suburban counties experienced growth rates in excess of 30 percent. Prince Georges County, Maryland, experienced the greatest population growth, in absolute terms, with a gain of 303,272 people. Montgomery County, Maryland, and Fairfax County, Virginia, followed with gains of 181,881 and 180,019, respectively.

Net migration figures for the Estuary Area provide further evidence of the movement of people out of rural areas and cities and into the suburban counties. Figure 3-3 illustrates net migration by county for the Region. As might be expected,

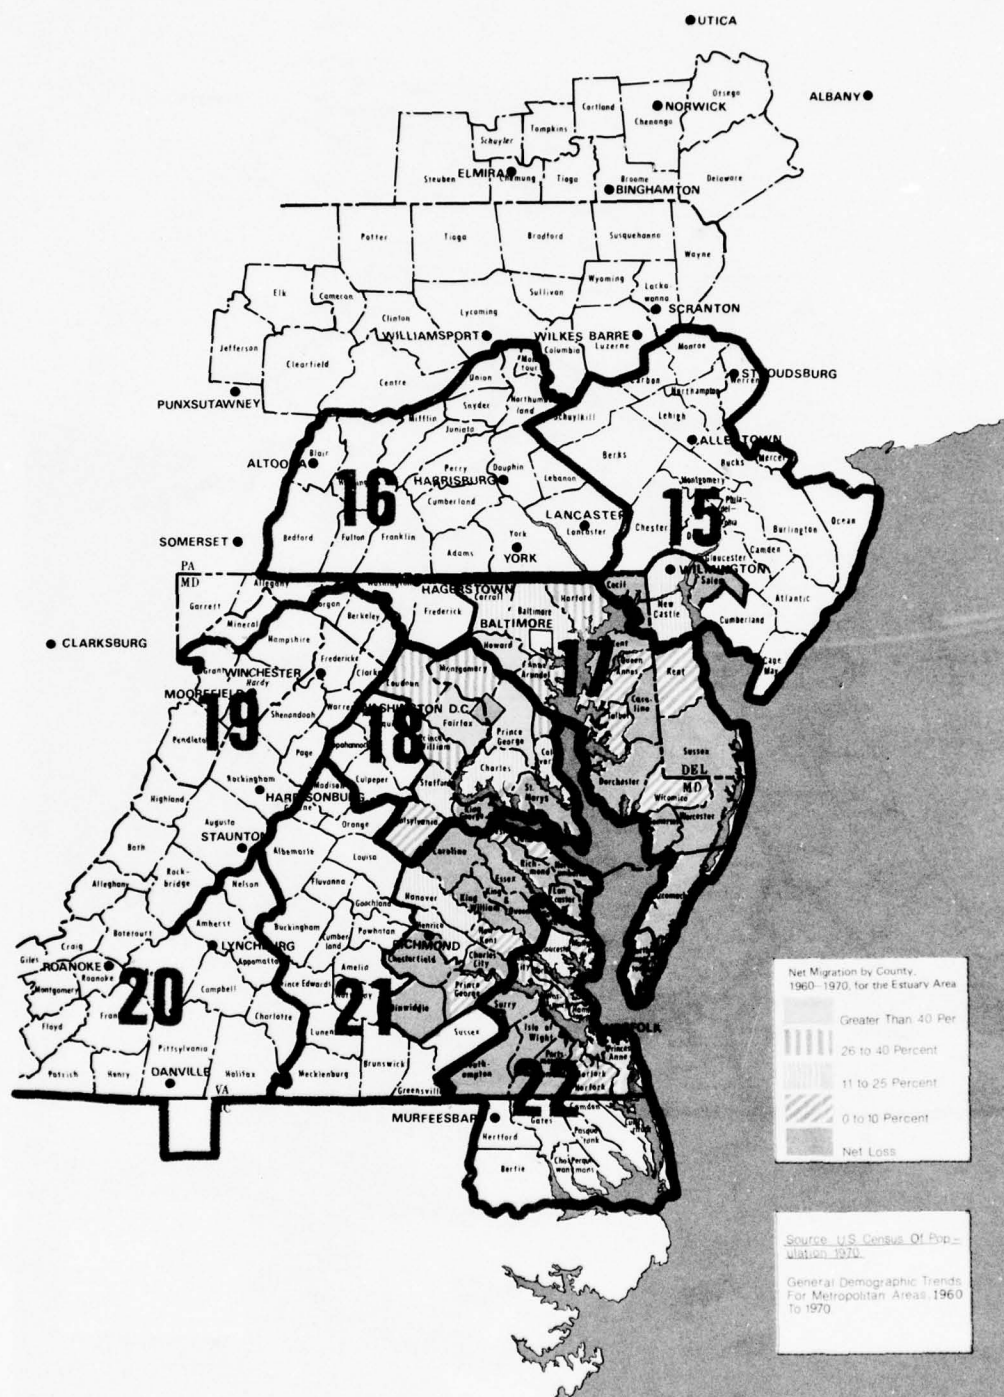

FIGURE 3-3

the counties in the Washington, D.C. SMSA experienced the largest absolute population gains due to net in-migration. Prince Georges County led with a gain of 200,646 migrants. Fairfax and Montgomery Counties ranked next with 154,890 and 126,899, respectively. The entire Estuary Area had a net population gain due to migration of 556,312 with the Washington, D.C. Subregion experiencing about 77 percent of this increase. Despite the fact that all of the Subregions and the Wilmington, Delaware SMSA experienced net immigration, 30 of the 58 counties and most of the major cities in the Area experienced net losses. Table 3-11 presents net migration data for each Subregion.

---

It is interesting to note the differences in migration patterns for various racial and income groups and the effects these migration patterns have had on the economic and social structure of the cities. In general, skilled white workers were moving out of the cities and into the suburbs while poorer and largely unskilled non-whites were moving out of the rural counties and into the inner cities. For example, a net total of over 138,000 whites migrated out of the District of Columbia during the 1960-1970 decade. During the same period, the city gained a net total of 38,000 non-whites. As a result, the average skill level of the city worker decreased; urban tax bases declined (resulting in either higher tax rates or in a deterioration in public services); and the cities became generally less attractive to

industry. The total number of manufacturing firms in the City of Baltimore has been declining for the last several decades. The City had 1,743 firms in 1950, 1,507 in 1960, and 1,195 in 1968.

Despite the general movement of people out of the major cities in the Estuary Area, the urban population of the Area continued to increase during the 1960-1970 decade as shown in Table 3-10. This happened because of the tendency of the city's out-migrants (as well as new migrants into the Region) to settle into smaller urban areas outside the cities. Urban dwellers increased by 1,486,091 during the 1960-1970 decade, while the rural population declined by 5,521. Figure 3-4 presents data for population density by county for the Estuary Area.

#### AGE DISTRIBUTION AND EDUCATIONAL LEVELS

The Chesapeake Bay Estuary Area has a larger percentage of its population in the productive labor force age group than does the Nation as a whole. This is due to the effects of the large net in-migration during the last several decades since the average migrant tends to be younger than those that stay behind. A large labor force age population means a smaller group in the less productive, and mostly dependent less than 18 and older than 64 age brackets. Figure 3-5 illustrates age distribution figures for the Estuary Area and the United States.

The labor force age population in each of the Subregions is also greater than the National figure as pointed out in Table 3-12. The Norfolk-Portsmouth Subregion had the highest population of productive workers due to the large numbers of military personnel stationed in the area. In 1970, there were approximately 109,000 members of the Armed Forces in the Subregion, or about 23 percent of the total labor force.

The Chesapeake Bay Region has a slightly higher skilled labor force than the Nation as a whole as measured by the percentage of high school graduates in the population. The proportion of high school graduates in the Estuary Area population (males 25 years old and over) is 53.8 percent. The National figure is about 53.0 percent.

There is a great deal of variation, however, in education levels within the Estuary Area. In fact, only the Washington, D. C. Subregion and the Wilmington, Delaware SMSA had a higher percentage of high school graduates than the Nation as a whole. Median school years completed, on a county level, range from a low of 7.5 years in Southampton County, Virginia, to highs of 14.3 in Fairfax County, Virginia, and 15.0 years in Montgomery County, Maryland. There is a direct relationship between the availability of high paying jobs and the general level of education in an area. As a result, the inhabitants of the suburban counties and the cities have the highest levels of educational attainment. This is clearly illustrated in Figure 3-6.

A significant number of city residents have also completed some form of vocational training. Table 3-13 presents data for the percentage of labor force age males who have completed some vocational training.

#### EMPLOYMENT AND INCOME LEVELS

In 1970, there were approximately 3.3 million people employed in the Chesapeake Bay Estuary Area. About 91 percent of these worked in one of the Region's seven SMSA's. During the 1960-1970 period, total employment increased by 760,075 jobs or about 30.0 percent. The National gain during this same period was 19.5 percent. Most of the Regional increases were in the Service, Wholesale and Retail Trade, and Public Administration Sectors with gains of 315,902, 147,465, and 126,246 jobs, respectively. It should be emphasized that the employment figures in this report are derived from the 1960 and 1970 Censuses. Census employment data is based on place of residence and not place of work. Therefore, if a person works in a different county or city from where he lives, employment data will be reflected for the county in which he resides. There

are several major differences between Census employment data and other data based on establishment figures. See the Introduction to the following Chapter for an explanation of these differences.

On a Subregion basis, all of the Subregions experienced rates of growth greater than the National rate as shown in Table 3-14. The Washington, D. C. Subregion experienced the greatest gains with a 43.0 percent increase. This employment growth was the major factor in drawing new people from all over the country into the Bay Region.

Employment by industrial Sector in the Estuary Area differs significantly from the National employment picture as shown in Table 3-14 and Figure 3-7. There is a higher percentage of Estuary Area workers in the "white-collar" professions such as Public Administration and the Services. On the other hand, the Region has a smaller proportion of workers in the "blue-collar" industries such as manufacturing and mining. The latter industries tend to be more volatile in terms of changes in employment in response to changes in the National economy. As a result, the industrial structure of the Estuary Area's economy has contributed to a relatively more stable employment situation than in the Nation as a whole. This is demonstrated in the comparative unemployment rates shown in Table 3-15. In both 1960 and 1970 unemployment rates for the entire Bay Region were significantly below the National rates. In all cases, except for the Baltimore Subregion in 1960, Subregion unemployment rates were also below the 1960 and 1970 National figures.

Also contributing to the relatively stable employment levels in the Bay Region was the large numbers of workers whose jobs depended on Federal Government spending, especially in the Defense-related industries. In 1970, approximately 16 percent of the Labor Force (including the Armed Forces) had jobs which were directly related to Defense spending, with many more thousands of jobs linked indirectly. Defense spending has experienced an almost uninterrupted rise since the end of World War II. For the most part, employment has risen along with spending. However, recent cutbacks (since 1970) in certain areas of the Defense and Space industries have had serious impacts in some of the Bay Region especially around Washington and Baltimore. Possible future cuts in the Defense budget could have tremendous adverse effects on the economy of the Area unless spending is increased in other areas to take-up the slack.

Per capita income in the Chesapeake Bay Estuary Area was significantly higher than in the United States as a whole. The

figure for the Bay Region in 1969 was \$3,694 per person while the National figure was \$3,389 (both in 1967 dollars). Per capita income (or some other measure of income) is another variable which is important in water resource planning. As incomes rise in a region, more water is demanded not only for sprinkling lawns, running dishwashers, filling swimming pools, etc., but also for recreational purposes.

Again there is a great deal of variation within the Estuary Area. Per capita income figures by Subregion in 1960 range from a high of \$4,241 in the Wilmington, Delaware SMSA to a low of \$3,084 in the Norfolk-Portsmouth, Virginia Subregion. Table 3-16 presents per capita income by Economic Subregion. On the county level, median family incomes ranged from \$16,710 in Montgomery County, Maryland, to \$4,778 in Northampton County, Virginia. Figure 3-8 clearly shows that the higher incomes are located in and around the major cities. This is another illustration of the fact that the vast majority of the economic activity in the Estuary Area is located in the SMSA's. Approximately 92% of the total income in the Area originated in the SMSA's.

Perhaps the most important measure of income for use in water resource planning is income distribution. The larger the proportion of the population in the high-income brackets the greater the demand for water for residential uses. As can be seen in Figure 3-9, there was a significantly higher proportion of families in the upper income brackets in the Estuary Area than in the United States as a whole.

Approximately 27.5 percent of the families in the Bay Region in 1969 had incomes over \$15,000. The National figure was 19.2 percent. On the other hand, there were fewer poor people in the Estuary Area. About 11.2 percent of the population lived in families whose incomes were below the poverty level in 1969, compared to a National rate of 12.2 percent. Both of these facts are consequences of the relatively low unemployment rates and high earnings which prevail in the Estuary Area.

FIGURE 3-9 : INCOME DISTRIBUTION FOR THE ESTUARY AREA AND THE UNITED STATES, 1969

### A SHIFT-SHARE ANALYSIS OF THE CHESAPEAKE BAY ESTUARY AREA

A common statistical technique for regional analysis is the shift-share method. This technique sorts out the various factors which relate to the differences in rates of employment growth. The standard of reference is usually the growth rate in the Nation as a whole. Table 3-17 presents two types of information. First, actual employment for the Estuary Area by industry in 1960 and 1970, along with the actual changes during this period. The second type of information consists of three parts. The first part, "National growth," shows the amount of growth which would have occurred at the National all-industry rate. The second part shows the employment change relating to "industrial mix," or the distribution of fast and slow growth industries in the Region. The growth rate in a particular industry is characterized as fast if it exceeds and slow if it falls short of the National all-industry rate. The third part, "regional share," relates to any change in employment due to an alteration in the Region's access to markets or basic inputs relative to other regions engaged in the same activity.

Table 3-17 shows the results of the shift-share analysis conducted on the Chesapeake Bay Estuary Area. Of the total employment change of 760,075 during the 1960-1970 decade, 494,009 of the gain was due to the general growth in the National economy. Another 175,197 of the increase in workers was due to the Estuary Area having a relatively high proportion of workers in fast-growth industries, e.g., Services and Public Administration. The remaining gain of 90,871 employees in the regional share category was accounted for by the fact that certain industries in the Estuary Area grew faster than the National rate for those industries, e.g., Services and Wholesale and Retail Trade. The total of the "National growth," "industrial mix," and "regional share" growth factors equals the total employment change.

The method of analysis is similar on the Sectoral level. For example, the employment change in Manufacturing would have been +96,558 had it grown at the National rate. But after making adjustment for the fact that this was one of the Nation's fast-growth industries and for the fact that the Estuary Area did not do as well (as far as employment growth is concerned) as the average region in the Sector, the actual employment change in the Manufacturing Sector was +29,301.

TABLE 3-17  
A SHIFT-SHARE ANALYSIS FOR THE CHESAPEAKE BAY ESTUARY AREA<sup>1</sup>

INDUSTRY	EMPLOYMENT		CHANGES RELATED TO			Total Change
	1960	1970	National Growth	Industrial Mix	Regional Share	
Agriculture, Forestry, and Fisheries	74,968	54,084	+14,619	-38,609	+3,106	-20,884
Mining	1,995	3,414	+389	-658	+1,688	+1,419

Wholesale and Retail Trade	417,731	565,196	+81,458	+16,709	+49,298	+147,465
Finance, Insurance, and Real Estate	106,887	157,974	+20,843	+9,085	+21,159	+51,087
Services	543,430	859,332	+105,969	+114,120	+95,813	+315,902
Public Administration	349,202	475,448	+68,094	+62,856	-4,704	+126,246
Armed Forces	210,795	249,403	+41,105	-16,864	+14,367	+38,608
Total	2,533,379	3,293,454	+494,010	+175,194	+90,871	+760,075

<sup>1</sup>It should be kept in mind that 1970 data for the total United States used in this analysis was estimated from 1968 data since employment information from the latest Census was not available at this writing.

Tables 3-18 through 3-22 present data for shift-share analyses performed for each of the Economic Subregions for the 1960-1970 period. The standard of reference for these analyses was the Estuary Area rather than the United States.

The next chapter of this report will analyze the economy of the Chesapeake Bay Estuary Area on a more detailed Sector by Sector basis.

### SUMMARY

During Colonial times the Chesapeake Bay Region was one of the primary growth centers of the New World. However, after the decline of the Region's tobacco industry in the 19th Century population growth began to lag. This period of relative stagnation lasted until World War II when greatly increased Federal spending (especially in defense) stimulated employment and, therefore, population growth throughout the Bay Region but especially around Washington, D.C. and Norfolk, Virginia.

Population growth in the Bay Region has continued to soar since World War II, increasing by 23.2 percent, or almost 1.5 million during the 1960-1970 decade. The Washington, D.C. Subregion experienced about 56 percent of the total growth, although all of the Subregions had rates of growth higher than the national increase. Approximately 38 percent of the population growth in the Area was the result of a net migration of over one-half million people into the Bay Region. All of the Subregions experienced net in-migrations which ranged from 2.1 to 19.3 percent of their 1960 populations.

Approximately 81.2 percent of the Bay Region's population was considered urban in 1970. The urban population increased by 1,486,091 during the 1960-1970 period while the rural population declined by 5,521. Generally speaking, people tended to move out of the inner cities and rural counties and into relatively small urban areas in the suburban counties. Most of the suburban counties experienced growth rates in excess of 30 percent.

The inhabitants of the Chesapeake Bay Region have a slightly higher education level than the population of the United States as a whole. In addition, the Bay Region has a large proportion

of people in the most productive 18 to 64 age group. Both of these factors are largely the results of the large migration into the Region during the last several decades. The average migrant tends to be younger and better educated than the average non-migrant. Large numbers of military personnel stationed in the Bay Region also contributed to the large group in the 16 to 64 age group. The counties in the Washington, D. C. area have the highest levels of educational attainment in the Bay Region. Median school years completed, on a county level, ranged from a low of 7.5 years in Southampton County, Virginia, to a high of 15.0 years in Montgomery County, Maryland.

In 1970, there were approximately 3.3 million people employed in the Chesapeake Bay Region. Total employment increased by over three-quarters of a million jobs, or about 30 percent over the 1960 figure. All of the Subregions experienced rates of employment growth greater than the National Rate. The Washington, D. C. Subregion had a 43 percent increase during the period, the highest in the Bay Region. Employment by industrial Sector in the Estuary Area differs significantly from the National employment picture. The Region has a smaller proportion of workers in the "blue-collar" industries such as Manufacturing and Mining and more in the "white-collar" industries such as Public Administration and the Services. Since the white-collar industries tend to be less volatile in terms of changes in employment in response to changes in the National economy, the Estuary Area has had consistently lower unemployment rates over the last several decades than in the Nation as a whole. Also contributing to the relatively stable employment levels in the Bay Region was the large numbers of workers whose jobs depended on constantly expanding Federal government spending.

Per capita income in the Chesapeake Bay Region was significantly higher than in the Nation as a whole. The figure for the Bay Region in 1969 was about 9 percent higher than the National figure. Median family income levels within the Estuary Area ranged from \$16,710 in Montgomery County, Maryland (the highest in the Nation), to \$4,778 in Northampton County, Virginia. There was a significantly higher proportion of families whose incomes were below the poverty level in the Bay Region than in the Nation as a whole.

A shift-share analysis was conducted on the Chesapeake Bay Region in Table 3-17. Of the total employment change of 760,075 during the 1960-1970 decade, 494,009 of the gain was due to the general growth in the National economy. Another 175,197 of the increase in workers was due to the Estuary Area having a relatively high proportion of workers in fast-growth

industries, e.g., Services and Public Administration. The remaining gain of 90,871 employees was accounted for by the fact that certain industries in the Estuary Area grew faster than the National rate because of an alteration in the Region's access to markets or basic inputs relative to other regions engaged in the same activity.

## CHAPTER IV

### ECONOMIC SECTORS

This chapter presents a detailed economic analysis by Economic Sector (Industry). The employment figures in Table 3-14, calculated from 1970 Census data, serve as the basis for this analysis. Emphasis is placed on each Sector's relationship to water resource planning whenever applicable.

Economic activity in the Bay Region can be divided into two types: "basic" or "export" and "service." Basic production is defined as that portion of an industry's product which is sold outside the region. This basic activity plays the central role in a region's development by bringing money into the area and thereby raising incomes. In the Chesapeake Bay Region the Sectors with significant amounts of basic production are: Manufacturing, the Federal government portion of Public Administration, the Armed Forces, Agriculture, and Fisheries. However, various-sized portions of each Sector can also be considered basic. The nature of the "product" of the Public Administration and Armed Forces is public services and defense, respectively, both of which are "exported" throughout the Nation.

The service industries grow in response to demands for special services by both the basic industry (communications, transportation, and other specialized services) and the basic industry worker (retailing, recreation, etc.). In the long run the service industries in a region will grow and decline along with the growth and decline of the export sectors. Generally speaking, for each new job in a basic activity about two more jobs are created in the services. This ratio, however, may vary considerably depending on the basic industry and the region being analyzed.

The industry breakdown used in this report is based on the breakdown in the 1970 Census. There are two main differences between the Census industry classifications and those used by other agencies (such as BEA in Chapter V) based on the Standard Industrial Classification (SIC) code. First, Census employment data is based on place of residence, not place of work. Second, the Census Bureau's "Public Administration" category covers only regular government functions (SIC 9x90) while the SIC "Government" category includes all government workers in all industries. To facilitate comparisons between the data contained in this report and that in other publications, SIC codes are given for the activities included in each Sector.

The SIC system is used to classify establishments by a number code according to the type of activity in which they are engaged. Establishments are classified on a 2-digit, a 3-digit, or a 4-digit basis, according to the degree of information which may be needed. For example, in the Manufacturing Division under Major Group 33 (primary metals) the activities of iron and steel foundries are classified as SIC code 332. At a still more detailed level the operation of steel investment foundries is denoted by SIC code 3324.

## MANUFACTURING

The Manufacturing Sector includes activities under SIC Codes 0713 and 20 to 29. There were 524,468 people employed in this Industry in 1970, comprising about 15.9 percent of the total employment in the Estuary Area. This figure was significantly lower than the National figure of 25.3 percent. Manufacturing employment in the Bay Region grew by 5.9 percent during the 1960-1970 period, which was also below the National growth rate of 7.8 percent.

The Manufacturing Sector ranked third in employment in the Estuary Area behind the Service and Retail and Wholesale Trade industries. As shown in Table 3-23, the major two-digit (SIC) employers in this Sector are Transportation Equipment, Chemicals and Allied Products, Printing, Publishing and Allied industries, and the Metal industries (Primary Metals and Fabricated Metal Products). There is also a significant

amount of employment in the "Other Durable Goods" category (mostly Scientific and Research Equipment along with Stone, Clay, Glass, and Concrete Products) and in the "Other Non-durable Goods" group, (mainly Tobacco Processing, Paper and Allied Products, Rubber and Miscellaneous Plastic Products, and Leather Products).

The influence of the large Government Sector and the maritime environment of the Estuary Area are evident in the structure of the Manufacturing Sector (see Figure 3-10). For example, the Printing and Publishing industry, which provides printing services for the various Government agencies in the Area, employed 10.7 percent of the total Manufacturing workers in the Bay Region as compared to 6.0 percent in the Nation as a whole. The Transportation Equipment industry employed 13.0 percent of the Estuary's total workers in Manufacturing as compared to a National figure of 10.8 percent. Many of these workers are engaged in shipbuilding activities throughout the Bay Region, particularly in the areas around Hampton Roads, Virginia and Baltimore, Maryland.

Despite the fact that the Manufacturing Sector was not as important in the economy of the Estuary Area as in the Nation as a whole (in terms of employment), the Sector still has a great deal of significance in the water resource planning process. First, the navigation channels in the Chesapeake Bay are used by many Area manufacturers as a means of shipping raw materials to their factories. For example, in the Baltimore Area several large iron, steel, and nonferrous metal refining companies have located at or near deepwater sites on the Bay because of their need for metal ores which are transported most economically by water. Second, many manufacturing firms use water in their production process, usually for cleaning or cooling purposes. For example, the steel industry uses approximately 24,000 gallons of water for each ton of steel it produces. This water is often returned to the Bay system either untreated or only partially treated. The Estuary Area is fortunate, from a water quality standpoint, that the Area's economy has a relatively low proportion of high water-using industries in the Manufacturing Sector. Of the five major water-using industries in the United States (Food and Kindred Products, Paper and Allied Products, Chemicals and Allied Products, Petroleum and Coal Products, and the Metal industries) the Chemicals and Allied Products industry and the Food and Kindred Products industry have a higher proportion of workers employed in the Bay Region than in the United States as a whole. (Figure 3-10). This picture changes somewhat when two counties in the Wilmington, Delaware SMSA (New Castle, Delaware, and Salem, New Jersey), which are located on the Delaware River system, are subtracted from the Estuary

**FIGURE 3-10: MANUFACTURING EMPLOYMENT FOR THE CHESAPEAKE BAY ESTUARY AREA AND THE UNITED STATES—1970**

SOURCE: U.S. Census of Population: 1970 General Social and Economic Characteristics, United States Summary, Table 92: "Industry of Employed Persons by Race for Urban and Rural Residence: 1970."

Area totals. The proportion of workers in the Chemicals and Allied Products industry decreases significantly from 11.4 percent of the total Manufacturing labor force to 7.4 percent of the total. At the same time, however, the Food and Kindred Products industry increases slightly from 9.3 percent to 10.1 percent. There were only minor changes in the proportion of workers in other industries after the adjustment.

Industrial water demands on the Bay system are less significant in the Chesapeake Bay as a whole than in many other estuaries in the United States. This is due to the fact that Manufacturing is a relatively low proportion of total economic activity in the Bay Region and that the majority of the Manufacturing activity that does exist is not of the type which requires large volumes of water. For example, in the Delaware Bay industrial wastes have virtually destroyed that body of water's usefulness for commercial and sports fisheries. However, problems do develop in certain areas of the Bay where manufacturing activity is concentrated. Problems can also occur with industry-related maritime activity. For example, the Chesapeake Bay is one of the major transshipment routes along the East Coast for the petrochemical industry. As a result of this type of activity, the Coast Guard reported that over 1 million gallons of oil were spilled into the Bay in 1970.

Over half (58.4 percent) of the total Manufacturing Sector employment is located in the Baltimore or Wilmington SMSA's. Other concentrations of Manufacturing activity are located in the Washington and Richmond SMSA's and in the Hampton Roads area. The heavy water-using industries are concentrated in the Upper Bay and in the counties bordering on the Delaware Bay. Employment in the Chemical and Metal industries is centered around Baltimore, Wilmington, and Richmond. Food and Kindred Products employment is concentrated on the Eastern Shore, in the Washington SMSA, and in Norfolk. Other significant concentrations of Manufacturing industries within the Estuary Area are: Printing and Publishing and the two Machinery categories in the Washington Subregion, Transportation Equipment in the Norfolk-Portsmouth Subregion, and Chemicals, and Tobacco processing in the Richmond Subregion. These industries will be discussed in more detail in the Subregion analysis below. Figure 3-11 illustrates the distribution of Manufacturing employment throughout the Bay Region by county. Figure 3-12 shows the county distribution of employment in heavy water-using industries (Metals, Food and Kindred Products, and Chemicals and Allied Products).

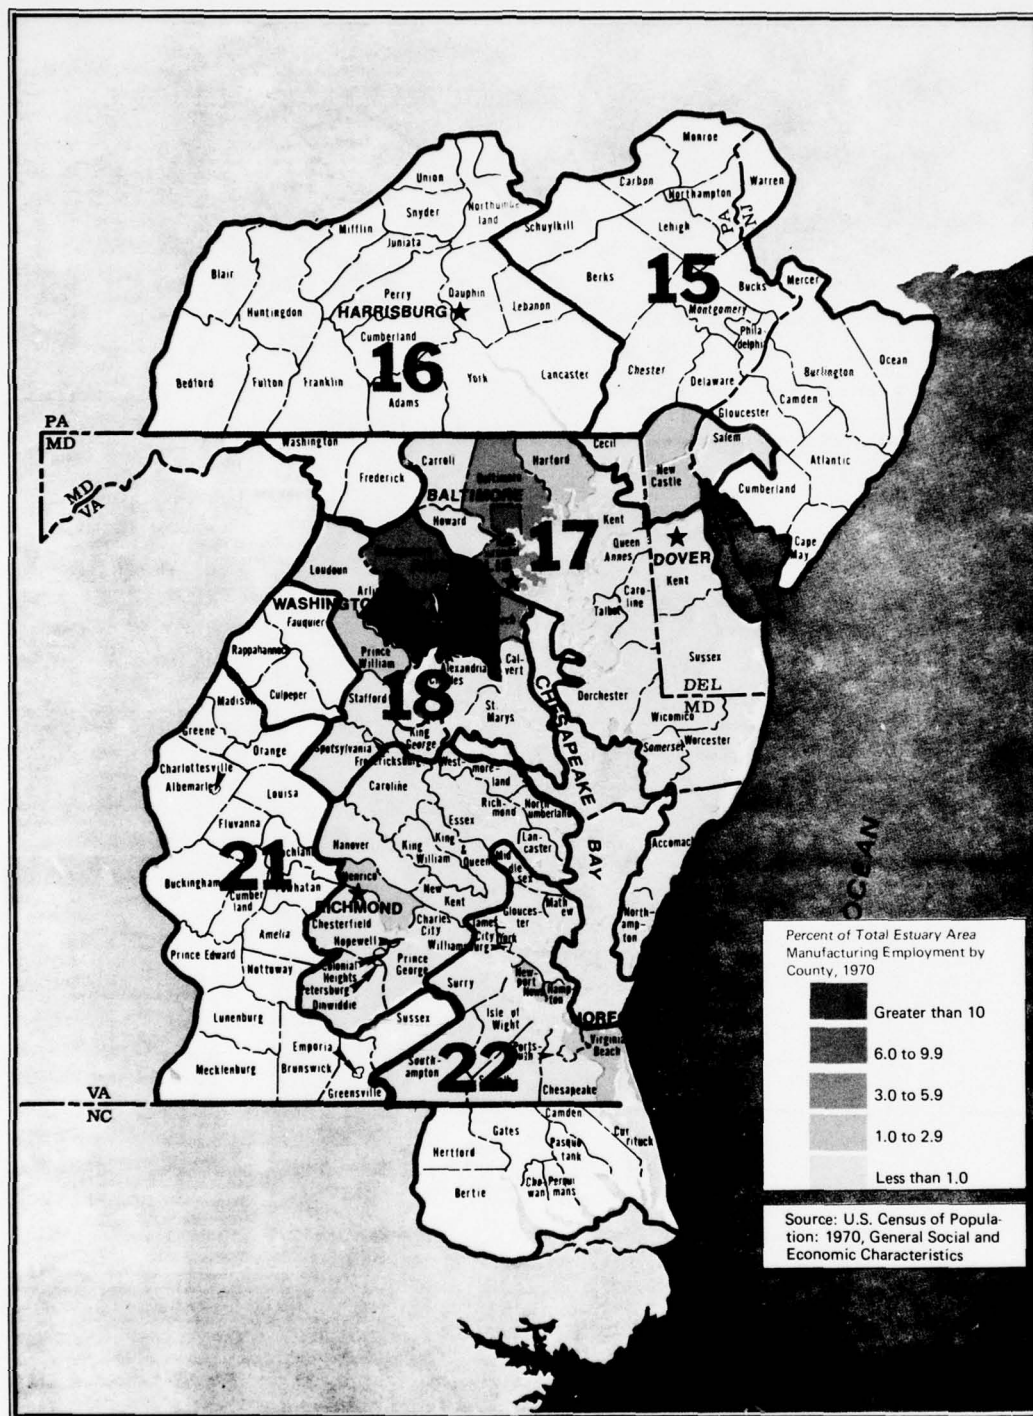

FIGURE 3-11

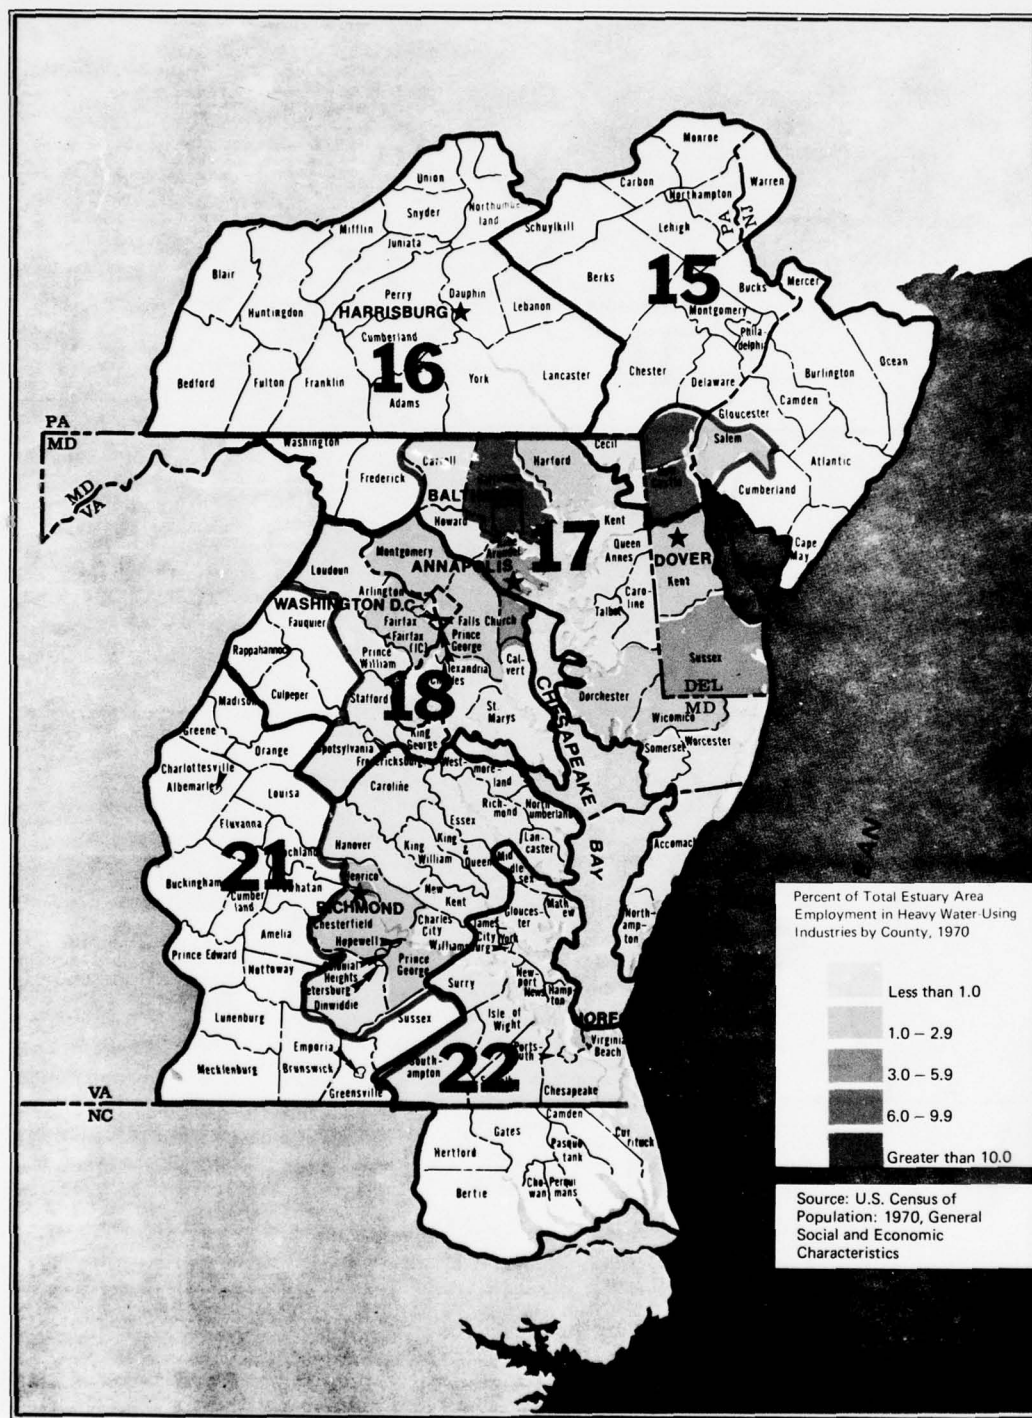

FIGURE 3-12

## BALTIMORE, MARYLAND SUBREGION

The City of Baltimore is one of the oldest and most important manufacturing centers in the United States. The Baltimore Subregion, consequently, dominates manufacturing activity in the Estuary Area. There were a total of 244,399 workers employed in the Manufacturing Sector of the Subregion or about 46.6 percent of the total Sector employment in the Bay Region in 1970. The Baltimore Subregion has a well-diversified Manufacturing Sector with no one industry having more than 17 percent of the total Sector employment. However, employment rose by only 0.2 percent, or by 544 workers, during the 1960-1970 period, significantly lower than both the National and total Estuary Area rates. There were large absolute increases in the "Other Durable Goods" category (mostly the Stone, Clay, and Gravel and the Scientific Instruments industries), in the "Other Non-durable Goods" category (mainly in Rubber and Miscellaneous Plastic Products), and in the two Machinery categories. These gains, however, were almost offset by decreases in the Metal industries, Transportation Equipment, and Food and Kindred Products categories.

The Manufacturing Sector accounted for 24.4 percent of the total employment in the Baltimore Subregion. It was the second most important industry in the Subregion in terms of numbers employed in 1970. As a large manufacturing center, Baltimore City has certain locational advantages over areas where there is no such concentration of industrial activity. This is the result of the wide range of services readily available to a firm which locates in such an urban-industrial center. These factors are called "agglomeration economies" in regional economics. One of the most important services provided to these firms is an excellent transportation system in general and the Port of Baltimore in particular. As a result, manufacturing activities in the City and Subregion often reflect this availability of water transportation. The following is an analysis of the major two-digit (SIC) manufacturing industries in the Subregion along with some of the locational advantages of the Subregion for each industry.

a. Metal Industries. (SIC 33 and 34). The area around Baltimore has had a long history of activity in the iron and steel industry. The Metal Industries have experienced sharp declines in employment in recent years (23.7 percent between 1960 and 1970) due to increased automation in the area's mills. Major employers in the Primary Metals category are the Bethlehem Steel Company, the Armco Steel Company, the Kennecott Refining Corporation, and the Eastern Stainless Steel Company.

Until recently, the Bethlehem Steel Company's blast furnace at its Sparrows Point plant was the largest in the world. The Fabricated Metal Products industry tends to locate near its primary metal suppliers and near major markets, making the Baltimore area a natural location. This type of activity is especially attracted to the Subregion because of the abundance of food processing plants producing canned fruits and vegetables. There are also many smaller firms in this category specializing in fabricated structural steel, fabricated plate works (boiler shops) and sheet metal work.

b. Food and Kindred Products (SIC 20 and 0713). There are two groups of manufacturers in this industry. The first group is drawn to the area because of the excellent transportation facilities and because of its proximity to the major Eastern and Midwestern markets. These major firms include a cane sugar refinery, two distilleries, and several breweries. Most of the employment in these firms can be classified as basic. The other group of manufacturers are attracted to the Baltimore Subregion because of its proximity to areas producing vegetables, poultry, and seafood. Most of this employment is located on the Delmarva Peninsula and most of the firms, with a few exceptions, are small (less than 200 employees). Employment is generally seasonal; wages are low, and a high proportion of the work force is female. Oysters, clams, crabs, and certain finfish, all abundant in the Chesapeake Bay Region, are processed by many of these firms. Tomatoes are the principal crops processed by the vegetable canning industry with corn, beans, cucumbers, and strawberries also being important. The poultry processing category also employs many people on the Eastern Shore. This is not surprising since the Delmarva Peninsula is one of the most important poultry raising areas in the United States.

The Food and Kindred Products industry has also experienced rather sharp declines in employment between 1960 and 1970 due to technological improvements in the food processing industry. Several counties on the Eastern Shore have been hard hit by this decline.

c. All Machinery (SIC 35 and 36). Employment in these two industries, especially electrical machinery, are heavily influenced by Department of Defense procurement policies. In general, employment is concentrated in a few firms located in the Baltimore SMSA. The industries require a proximity to a supply of primary metals, good transportation systems to other urban areas, and a large number of services from other manufacturing firms. Many of the firms in the Electrical Machinery industry also carry on research and development work as well as their manufacturing activities. Baltimore

enjoys a locational advantage in this type of activity due to its proximity to the Washington, D.C. research and development (R & D) complex. Major employers in the Subregion are Crown Cork and Seal Company, Incorporated; Black and Decker Manufacturing Company; and Koppers Company, Incorporated, in the Non-Electrical Machinery category and the Bendix Corporation, the Western Electric Company, and the Westinghouse Corporation in the Electrical Equipment industry. The two industries experienced significant increases in employment during the 1960-1970 period due to the large increases in Defense contracts during the period and because of the general rise in demand for durable goods such as kitchen appliances, radios, and power tools.

d. Transportation Equipment (SIC 37). This is another industry which, except for several General Motors plants, depends almost entirely on Defense and other Federal contracts. Most of the firms produce either aircraft, space vehicles, or ships. Again, the Baltimore subregion has a locational advantage in these activities due to its excellent transportation facilities, and its proximity to the Washington R & D complex. Major employers in this industry are the Fairchild Hiller Corporation and the Martin Marietta Corporation. The deepwater port facilities offered by the Port of Baltimore make the area an excellent location for shipbuilding activities. The Bethlehem Steel shipyard is located in Baltimore County and is by far the largest employer of the many shipbuilding firms in the Baltimore Subregion, producing both for commercial and military interests. Other shipyards produce small pleasure and fishing craft. This industry has also suffered sharp declines in employment due to decreases in related space and military contracts during the 1960-1970 decade.

e. Textiles and Fabricated Textile Products (SIC 22 and 23). Baltimore City has historically been an important producer of textiles and apparel due to its proximity to Southern cotton sources. This industry has remained important in the area although during the last several decades manufacturers have turned more toward the synthetic fibers. The production of men's clothing is especially important in the area since this type of activity is not attracted to style centers as is the manufacture of women's clothing. The industry in the Baltimore area has lost some of its attractiveness to new firms because of increasing labor costs in this labor-intensive industry. As a result, there were slight decreases in employment during the 1960-1970 decade.

f. Other Industries. The Furniture and Wood products industry is attracted to the area because of Baltimore's function as a transshipment point for lumber, and because of the

nearness of major Eastern markets. The Scientific Instruments industry is drawn to the area because of its proximity to the R & D complex in the Washington, D.C. area and because of the numerous manufacturing services offered in and around Baltimore City. The Subregion also has a locational advantage for the Chemical and Allied Products industry because of Baltimore City's role as a transportation junction point, and particularly because of the availability of waterside plant sites since the bulky raw materials used in this industry are often most economically transported to the factory by water.

#### WASHINGTON, D.C. SUBREGION

Because of the District of Columbia's primary function as the Nation's Capital, the Washington Subregion has never developed into an important manufacturing center. The majority of the manufacturing activity which has become established in the area is related to the activities of the Federal Government. For example, the Printing and Publishing industry, which provides its services to the numerous Federal agencies in the area, employs over one-third of the Manufacturing workers in the Subregion. The large defense-related R & D in the Washington area is also a significant source of manufacturing employment in the Subregion although Baltimore has benefited to an even greater extent because of its well-established manufacturing complex combined with its proximity to Washington.

The Manufacturing Sector employed 83,005 workers in 1970. This amounted to about 15.8 percent of the total Sector employment in the Estuary Area. Employment experienced modest gains during the 1960-1970 period. The 14.1 percent increase was significantly higher than the Regional rate. The largest increases were in the two Machinery categories and in Printing and Publishing. There were decreases, however, in the Metal Industries and in Food and Kindred Products.

The Manufacturing Sector accounted for 6.3 percent of the total employment in the Washington Subregion in 1970. It was the fourth most important industry in the Subregion in terms of numbers employed. Listed below are some of the major two-digit (SIC) manufacturing industries in the Washington Subregion.

a. Printing and Publishing (SIC 27). The Washington Subregion contains the majority (52.6 percent) of the Estuary Area's employment in this industry. This category is also,

by far, the most important in the Manufacturing Sector in the Subregion. This industry is attracted to the Subregion because of the concentration of Federal Government activities with their tremendous demands for printing services. Almost half of the industry's employment is located in Prince Georges and Montgomery Counties, Maryland. Most (about 75 percent) of the employment is classified as commercial printing with the remainder in the newspapers and periodicals category. The industry experienced moderate employment gains during the 1960-1970 period (about 9.0 percent). This was lower than the total Manufacturing increase for the Subregion. Improvements in output per worker in the industry have had a dampening effect on employment during the last decade.

b. Electrical and Non-Electrical Machinery (SIC 35 and 36). The two machinery categories are examples of industries which are attracted to the area because of the defense-related R & D complex in the Washington area. The firms in these groups are either directly involved in research and development activities or they are suppliers to such firms. Most of them are located in the Maryland and Virginia suburbs of Washington, D.C. With a few exceptions, like Vitro Laboratories, these firms are relatively small employers. Major products include electronic communication equipment, computer equipment, warfare and aerospace systems, information management systems, and peripheral computer equipment. The two industries together experienced a 75.1 percent employment increase during the 1960-1970 decade.

c. Other Industries. The Fabricated Metals industry is the major employer in the Metal Industries category. Activities are oriented toward supplying ornamental metal work, heating ducts, metal doors, metal molding and trim, and other products related to the construction industry.

The Food and Kindred Products industry, serving the large urban population in the area, is also relatively important although most of the agriculture products are grown outside of the Subregion. The seafood processing industry is also important in the area. The Potomac and Patuxent Rivers, both located in the Subregion, are important sources of both shellfish and finfish.

## RICHMOND, VIRGINIA SUBREGION

The tobacco industry is at the hub of the Richmond Subregion's Manufacturing Sector. The City of Richmond is one of the major tobacco processing centers in the United States. This industry has attracted several other types of industries to the area oriented towards providing needed services and products to the tobacco industry. For example, the Paper and Primary Metals industries supply the basic materials (paper and aluminum foil) for cigarette wrappings and containers.

There were 67,267 workers employed in the Manufacturing Sector in 1970 or about 12.8 percent of the total Bay Region employment in the Sector. Employment rose by 11.6 percent during the 1960-1970 decade, or by 6,981 workers. This was higher than both the Regional and National rates. The greatest increases were in Chemicals and Allied Products, and Textiles and Fabricated Textile Products. Decreases occurred in Food and Kindred Products, and Furniture, Lumber, and Wood Products. The last two categories were the only ones in the Manufacturing Sector to show declines during the period.

The Manufacturing Sector accounted for 22.3 percent of the total employment in the Subregion. It was the second most important Sector in the Subregion, in terms of numbers employed. Some raw materials for the area's Chemical industry are shipped up the James River to Richmond and Hopewell. Utilization of the Port has been hampered by the relatively shallow 25-foot depth of the channel. Only about 10 percent of today's oceangoing vessels are able to navigate a channel of this depth. The following are some of the important industries in the Richmond Subregion.

a. Tobacco Industry (SIC 21). Most of the important tobacco companies have major plants located within the Richmond Subregion. The industry was originally attracted to the region because of the abundance of tobacco plantations along the James River and its tributaries. Tobacco cultivation has since shifted to the west and south; but, Richmond and Petersburg have remained important tobacco processing centers largely because of the ready availability of certain required manufacturing services and materials (aluminum foil, cellophane, paper products, and packaging services) and because of a large supply of semi-skilled female labor.

Census data does not break down manufacturing employment into enough detail to show the numbers of workers in the tobacco industry. Tobacco industry workers are included in the "Other

Nondurable Goods" category. However, partial data shows that employment in this industry has remained fairly constant during the 1960-1970 period.

b. Chemicals and Allied Products (SIC 28). The major products of this industry are plastic resins, synthetic fibers, basic chemicals, and fertilizers. The two largest firms are the Allied Chemical Corporation, the DuPont Company, Incorporated, and the Hercules Powder Company. A large part of the output of this industry is cellophane used in packaging cigarettes. The major locational advantage for the industry is the availability of raw materials, some of which are transported by barge up the James River.

The industry experienced sharp gains during the 1960-1970 period. The increases were due to the general growth in the industry nationwide and the increased demands for explosives during the Vietnam War.

c. Printing, Publishing, and Allied Industries (SIC 27). A large part of the employment in this industry (about one-third) is engaged in supplying printing services for the tobacco industry and the State and local governments. The rest publishes newspapers and periodicals for local markets. Employment in this category increased slightly during the 1960-1970 period. An increased demand for printing services was almost offset by improvements in output per worker.

d. Metal Industries (SIC 33 and 34). This category is dominated in the Subregion by the Reynolds Aluminum Company. One of the major products of the firm is aluminum foil, part of which is used by the tobacco industry for packaging cigarettes. Most of the production, however, is shipped out of the Subregion. The Reynolds Company also produces extruded aluminum products which have stimulated the development of an important Fabricated Metals industry in the Subregion. Major products of the category include metal doors and sashes, hardware, heating equipment, structural steel, and boilers. Several gray iron foundries are also located in the Subregion.

There was a slight decline in employment in the Metal Industries during the 1960-1970 period due to increased automation in the plants.

e. Other Industries. The Textile and Furniture industries are attracted to the Subregion because of low labor costs and the area's central location with respect to markets. An additional advantage for the Furniture industry is the ready supply of lumber. The major Textile firms produce broadwoven fabrics and children's and men's clothing. The output of the

Machinery industry is divided between tobacco processing machinery and food processing equipment. The Food and Kindred Products industry is also an important employer in the Subregion. The canning of fruits and vegetables, and the preparation of seafood and meats are important activities. There is also a group of large firms producing biscuits, cookies, and related products which are marketed throughout the East.

#### NORFOLK-PORTSMOUTH, VIRGINIA SUBREGION

The structure of the Manufacturing Sector in the Norfolk-Portsmouth Subregion is dominated by the Subregion's coastal location. The Transportation Equipment industry is by far the most important employer in the Sector. The majority of workers in this industry are employed in Shipbuilding activities. The shipyards, in turn, have attracted machinery and fabricated metal plants. The existence of four deepwater ports in the Subregion (Newport News, Norfolk, South Norfolk, and Portsmouth) have attracted some firms in the Chemical and Automobile industries.

The Manufacturing Sector employed 67,661 workers in 1970 or about 12.9 percent of the total Sector employment in the Estuary Area. Manufacturing experienced a moderate increase of 14.3 percent during the 1960-1970 period. This was higher than the rates for both the Bay Region and the Nation. Important increases occurred in the Electrical Machinery and Transportation Equipment categories. Only three industries experienced losses during the period--Food and Kindred Products, the Metal Industries, and Printing and Publishing.

The Manufacturing Sector accounted for 14.6 percent of total employment in the Norfolk-Portsmouth Subregion. It was the fourth most important employer in the Subregion. Some of the important two-digit (SIC) Manufacturing industries are listed below.

a. Transportation Equipment (SIC 37). About 90 percent of the employment in this industry is accounted for by shipbuilding and repair industries. The three major employers are the Newport News Shipbuilding and Dry Dock Company, Incorporated, the U. S. Navy, Norfolk Shipyard, and the Norfolk Shipbuilding and Dry Dock Corporation. There are also a number of smaller firms which handle small fishing and pleasure crafts. Most of the rest of the employment in the Transportation Equipment industry is in a Ford Motor Company assembly plant located in the Norfolk area.

This industry is extremely dependent on Federal Defense spending and on the Merchant Marine subsidy program. Norfolk is a major center for the Navy's Atlantic Fleet operations. The Vietnam War and an increased emphasis on rebuilding and expanding the Nation's Merchant Marine Fleet led to an increase of almost 4,000 employees during the 1960-1970 decade.

b. Food and Kindred Products (SIC 20 and 0713). Most of the firms in this industry are engaged in the processing of vegetables, fruits, seafood, and especially peanuts. These commodities are harvested in abundance in the Subregion. There are also several bakeries and a few firms producing bottled and canned soft drinks, mostly for local consumption. Most of the employment in the industry is engaged in producing for export out of the Subregion.

The industry suffered sharp losses during the 1960-1970 decade due to increased automation in the plants. Because of the relatively high prevailing wages in the Subregion (due to competition from the high-wage Transportation Equipment industry), firms in the Subregion have more incentive to mechanize than plants in other areas.

c. Other Industries. Much of the employment in the Machinery categories is engaged in work relating to the Shipbuilding industry. Several firms in these industries are operated by the same firms which operate the shipyards. Several moderately sized firms produce miscellaneous electrical apparatus and air-conditioning and refrigeration machinery. The Printing and Publishing industry produces for local markets with about 75 percent of the workers employed in publishing newspapers. The Fabricated Metals industry is still another which is heavily oriented toward shipbuilding activities. There are also firms producing metal doors, sashes, and frames. The Chemical industry is attracted to the area because of the excellent transportation facilities and the availability of raw materials (especially oyster shells). The Agricultural Chemical industry employs over 60 percent of the workers in this category.

#### WILMINGTON, DELAWARE SMSA

There were a total of 62,136 workers employed in the Manufacturing Sector of the Wilmington SMSA, or about 11.8 percent of the total Sector employment in the Estuary Area in

1970. Employment in the Sector increased by a modest 5.2 percent during the 1960-1970 period. The most significant increases occurred in the Transportation Equipment and Chemicals and Allied Products Industries. Losses took place in Food and Kindred Products and in Textiles and Fabricated Textile Products.

The Manufacturing Sector accounted for 31.6 percent of the total employment in 1970 in the SMSA, making it the most important employer in the area. Because the industries in the Wilmington Subregion, except for Cecil County, Maryland, are not located on the Chesapeake Bay, a detailed analysis of the Manufacturing Sector in this Subregion is not presented. Important industrial categories are discussed briefly below, however, with emphasis on Cecil County.

The Manufacturing Sector of the Wilmington SMSA is based on the Chemical and Allied Products Industry. The oldest and largest of the chemical companies, E. I. du Pont de Nemours, was founded along the Brandywine Creek in New Castle County, Delaware, in 1802. The Company still has its headquarters and several large plants employing many thousands of people in the area. In addition, a plant producing rocket propellents is one of the largest employers in Cecil County, Maryland. The Chemical Industry is attracted to the area because of the availability of water transportation, raw materials, and the large quantities of fuel (mostly petroleum) needed in the production process. The Transportation Equipment industry (mostly shipbuilding) is also attracted to the area because of its coastal location. The largest firm in the Electrical Machinery Industry is the R. M. R. Corporation in Cecil County which produces electric motors.

### PUBLIC ADMINISTRATION

The Public Administration Sector includes civilian workers in the postal service and Federal, State, local, and international governments (SIC codes 43, 91, 92, 93, 94, 95, 96, and 97). In 1970, there were 475,448 employees in this industry, or about 14.4 percent of the total employment in the Estuary Area. This is significantly higher than the figure of 5.5 percent for the United States as a whole. Employment in this Sector grew

36.2 percent during the 1960-1970 period which was above the 31.5 percent rate of growth for the Nation.

The Public Administration Sector ranked fourth in total employment in the Estuary Area. However, for several reasons this industry is far more important to the Region's economy than these employment figures indicate. First, earnings are higher than average in this Sector. These high, steady paychecks have helped to stimulate other Sectors of the economy, especially the Retail Trade and Service industries. Second, the Federal portion of the Public Administration Sector can be thought of as a "basic" industry since it exports its "product" (public services) to the entire Nation, therefore bringing money into the Region and raising incomes.

The bulk of the total Public Administration employment in the Estuary Area (almost 66 percent) is located in the Washington, D. C. Subregion. Other concentrations of workers are located in the Richmond, Virginia vicinity, throughout much of the Baltimore, Maryland SMSA, and in the major urban areas of the Norfolk-Portsmouth Subregion. Figure 3-13 illustrates the percentage of total Estuary Area Public Administration employment which is located in each county.

During recent decades, employment in the Federal, State, and local governments has experienced impressive increases as population has continued to grow, and these governments have increased their regulatory and administrative duties. This has been especially true for the last two categories. For example, between 1950 and 1970 Federal government employment increased by about 42 percent while State and local employment increased by approximately 120 percent. Employment in the Public Administration Section has increased right along with this general increase in government employment. Since three State capitals (Annapolis, Maryland; Richmond, Virginia; and Dover, Delaware) are located in the Estuary Area, the Region's economy has greatly benefited from this expansion.

#### BALTIMORE, MARYLAND SUBREGION

The Baltimore Subregion ranked second in the Estuary Area in employment in the Public Administration Sector with a total of 88,586 workers in 1970. This amounted to 18.6 percent of the total Sector employment in the Region. Employment rose by 53.3 percent during the 1960-1970 period, significantly higher than both the National and Regional rates, indicative of a high proportion of workers on the State and local levels.

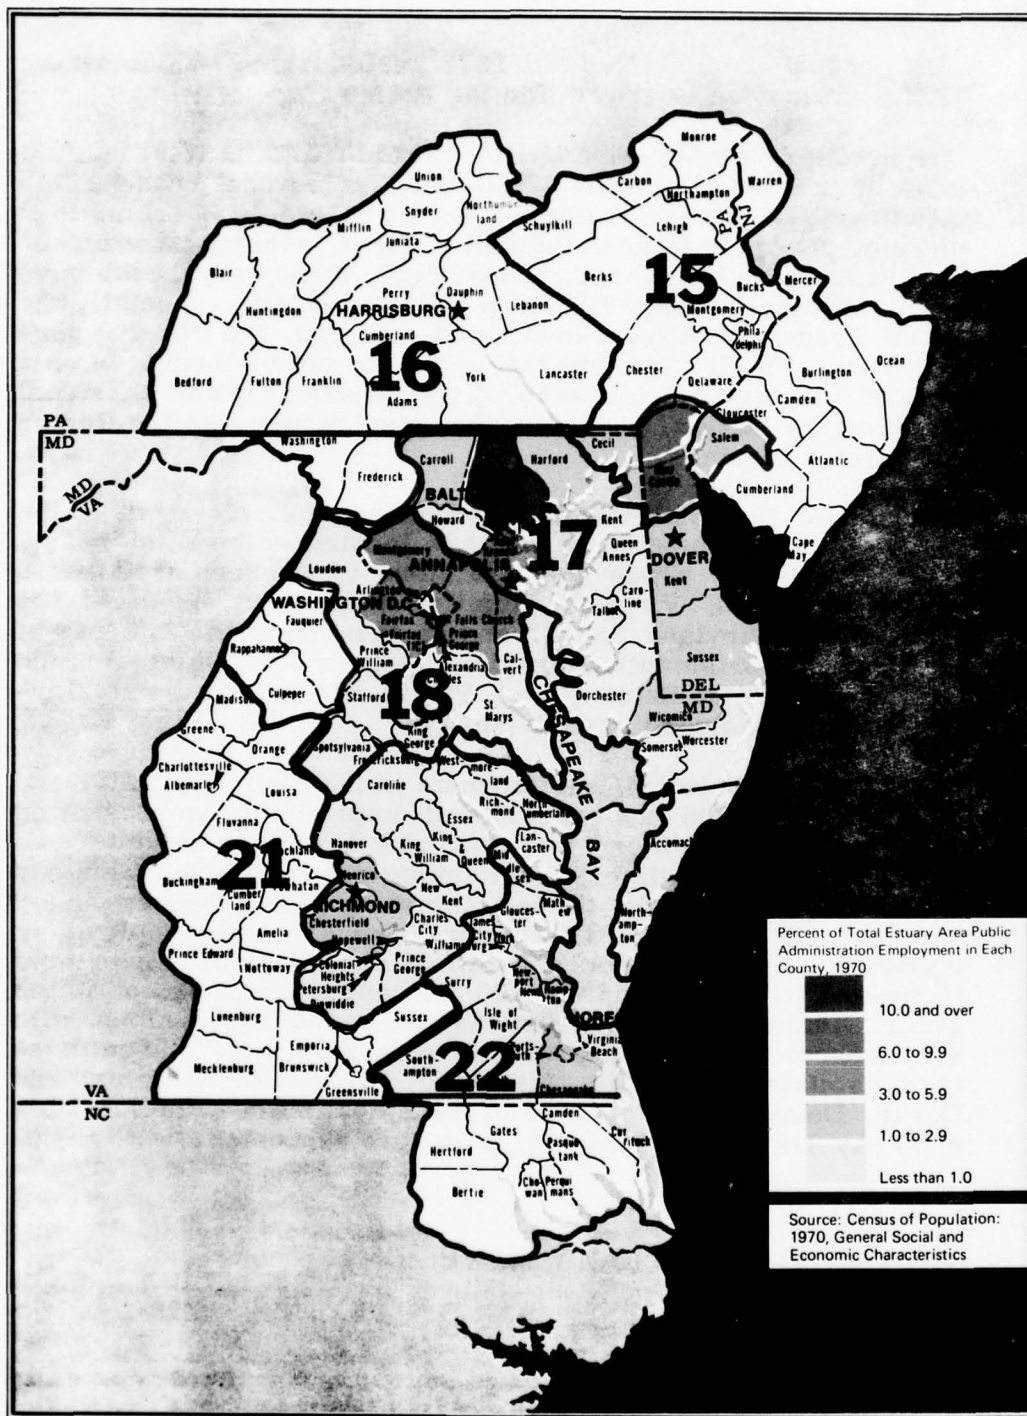

FIGURE 3-13

The Public Administration Sector accounted for 8.8 percent of the total employment in the Baltimore Subregion in 1970. Two State capitals, Annapolis and Dover, are located in this Subregion and Baltimore City itself has a large number of Federal, State, and city government employees. Roughly, 40 percent of the workers in this Sector were employed by the Federal government with an equal proportion employed on the local level. The remaining 20 percent worked for the State governments.

The major employers in the Federal portion of the Public Administration Sector are the Post Office and the Social Security Administration in Baltimore County which is the National Headquarters for the Social Security Program. There are numerous other Federal employees in this Sector working as support personnel at the many armed forces installations throughout the Subregion (see the Armed Forces Section below). Baltimore City has the largest concentration of Maryland State employees (about 28 percent of the total), with Baltimore (16 percent), Anne Arundel (13 percent), and Carroll (5 percent) Counties also having significant numbers of state workers. The two Delaware counties in the Subregion, Kent and Sussex, provide about 38 percent of the total Delaware State employment, most of this in the Dover area. There is an insignificant amount of State employment in the Virginia portion of the Baltimore Subregion. Employment on the local level is roughly proportional to the population in each locality.

#### WASHINGTON, D. C. SUBREGION

The Washington Subregion was first in the Bay Region in employment in the Public Administration Sector with a total of 312,012 workers in 1970. This amounted to 65.6 percent of the total Sector employment in the Estuary Area. Employment increased by 33.0 percent during the 1960-1970 period. This rate was lower than both the National and Estuary growth rates due to the fact that Sector employment in the faster growing State and local governments was a relatively small proportion of total employment in Public Administration.

The Public Administration Sector accounted for 23.5 percent of total employment in the Washington, D. C. Subregion. It was the second most important employer in the Subregion in 1970. The Federal government was the major employer in this Sector with roughly 75 percent of total employment. This is to be expected since almost all the Federal departments and agencies have their National headquarters in the Capital Area.

Although the Public Administration Sector was only ranked second in importance in the Washington, D.C. Subregion, this Sector (and other related Federal activities) have dominated the economy of the area since the Civil War. Nearly all Sectors of the Subregion's economy, but especially the Service, Manufacturing, Finance, and Communications industries, have strong ties with the Federal government. This point will be discussed further in the write-ups dealing with each Sector.

In recent years, a trend has developed away from the historic centralization of Federal activities in the District of Columbia. New Federal jobs have tended to locate in the Washington suburbs and in other parts of the country rather than in the District itself. For example, "at place" total Federal employment increased 25 percent in the Capital City during the 1961-1969 period. In the Maryland and Virginia suburbs the increase was approximately 51 percent. However, the majority of the Federal jobs (about 67 percent) in the Subregion were still located in the District. The thirteen counties and independent cities in the Subregion employed significant numbers of people at the local level (roughly 20 percent of total Sector employment). Several State offices employed relatively small numbers of workers in both Maryland and Virginia.

#### RICHMOND, VIRGINIA SUBREGION

The Richmond Subregion ranked fourth in Public Administration employment in the Estuary Area with a total of 22,517 employees in 1970, or 4.7 percent of total Sector employment in the Bay Region. Employment in this industry rose by 44.2 percent during the 1960-1970 period. This growth rate was higher than both the National and Regional rates due to the high proportion of State and local Public Administration workers in the Subregion.

The Public Administration Sector accounted for 7.5 percent of the total employment in the Richmond Subregion in 1970. Richmond is the State capitol of Virginia and consequently the State portion of total Public Administration employment is significant (about 38 percent). Since there are 15 counties and four independent cities in the Subregion, local government employment is also very important in the area, comprising about 37 percent of the total. In addition to the usual postal workers, there was significant Federal employment in this Sector at the several large armed forces installations in the Subregion. Federal workers made-up about 25 percent of total industry employment.

## NORFOLK-PORTSMOUTH, VIRGINIA SUBREGION

There were 44,833 workers employed in the Public Administration Sector of the Norfolk-Portsmouth, Virginia Subregion or 4.7 percent of total Sector employment in the Estuary Area. This was the third highest total of any Subregion. Employment in this industry grew at a relatively low 27.3 percent, lower than both the National and Bay Region rates. This reflects the high proportion of employees in the slower-growing Federal part of the Public Administration Sector.

This Sector accounted for 9.7 percent of the total employment in the Norfolk-Portsmouth Subregion in 1970. The majority of the workers were employed in the Hampton Roads and Virginia Beach sections of the Subregion. The Federal government employed roughly 70 percent of the workers. Most of these were employed as support personnel in the numerous armed forces bases located throughout the Subregion. Approximately 25 percent of the workers in the Sector were employed by local governments. There are 10 county and eight independent cities in the subregion. The Virginia State government employs a relatively minor percentage (roughly five percent) of the Sectors' total employment in several Regional Offices located in the Subregion.

## WILMINGTON, DELAWARE SMSA

There were 7,500 Public Administration employees in the Wilmington, Delaware SMSA, the lowest number of any Subregion in the Estuary Area. This figure represented 1.6 percent of the total Estuary employment in this Sector. There was an increase in employment of 24.1 percent between 1960 and 1970, the lowest rate of growth for this Sector in the Estuary Area.

Public Administration accounted for 3.8 percent of the total employment in the Wilmington SMSA. Employment was fairly evenly split between the State and local governments with roughly 40 percent working at the State level and about 35 percent at the local level. Almost of all of the State employment was in New Castle, Delaware. In fact, about 62 percent of the total Delaware State employment is located in this county despite the fact that the State's capitol is in Dover.

## AGRICULTURE, FORESTRY, AND FISHERIES

The Agriculture, Forestry, and Fisheries Sector included SIC codes 01, 02, 07, 08, and 09. Employment in 1970 in these industries totaled 54,084 or 1.6 percent of all those employed in the Estuary Area. This represented a 27.9 percent decrease over the 1960 figure compared to a decline of 37.9 percent in the United States as a whole. The National employment in this sector, while decreasing at a more rapid rate than that within the Estuary Area, still constituted a larger proportion of the total labor force (3.6 percent as compared to 1.6 percent for the Bay Study Area).

a. Agriculture. Next to Mining, the Agriculture, Forestry, and Fisheries Sectors employed the least number of people within the Estuary Area. Most of these (67.8 percent or 36,686 people) were engaged in Agriculture. Forestry and Fisheries employment accounted for the remaining 32.2 percent of the total labor force in this Sector (17,398 people). The Estuary Area has long been an important agricultural region but increased urbanization in recent years has affected both the type of agriculture and the nature of the commodities produced. At present, the Region has a varied agriculture.

The value of all farm products sold by commercial farms in 1969, by county, is shown in Figure 3-14. Wicomico and Worcester Counties, Maryland, and Sussex County, Delaware, had the highest value of products sold. Other large portions of the States of Maryland and Delaware also maintained comparatively high values. The value of both crops and livestock and poultry in the Chesapeake Bay Study Area Subregions for 1954, 1959, 1964, and 1969, is shown in Table 3-24. For the Estuary Area as a whole, the value of both crops and livestock and poultry has steadily increased. For example, total value of all agricultural products rose over 61 percent between 1954 and 1969. Likewise, each of the Subregions has experienced an increase in value of agricultural products since 1954. Livestock, poultry and their products have traditionally provided a greater income for the Area than have crops. Figure 3-15 shows the value of production by county, for livestock and poultry. In similar fashion, Figure 3-16 shows the value of crops including nursery products and hay.

The Estuary Area as in the case of other areas of the U.S. and especially the Eastern Seaboard Region, has been undergoing a process of urbanization. Not only has the amount of

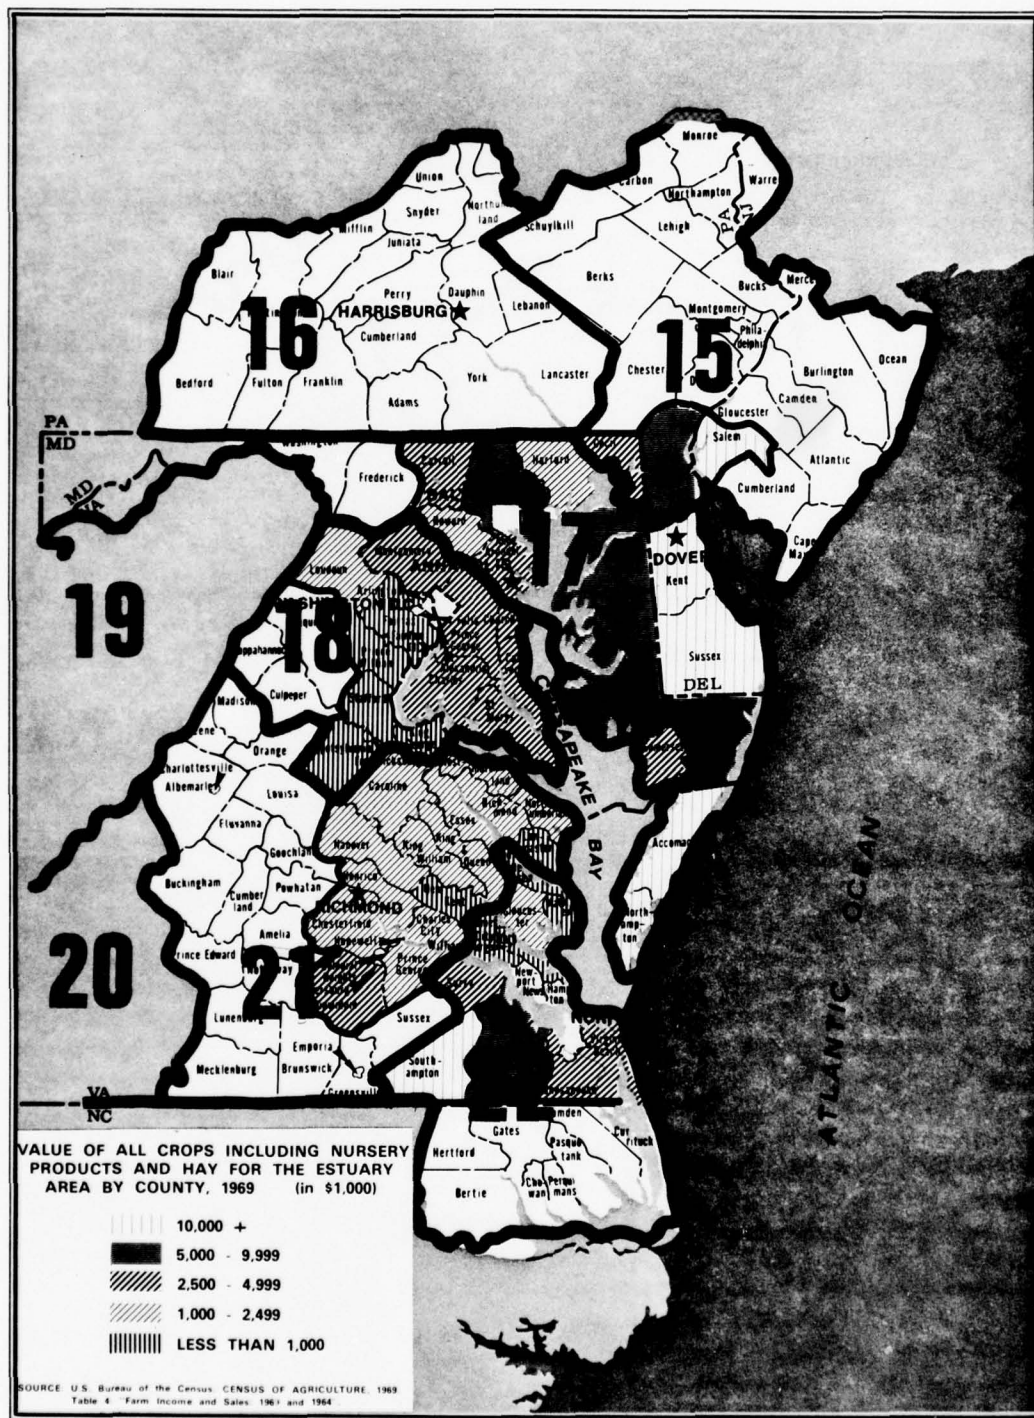

FIGURE 3-16

land in farms been declining but so too has the number employed as farmers, farm managers, laborers, and foremen.

Even with this decrease in agricultural land, agricultural production is increasing. Chemical fertilization has been at least partially responsible for this increased production while at the same time it is of serious consequence to the land and water resources of the Bay. Chemical fertilizers add nutrients to the waters of the Bay and its tributaries which results in an increase in the amount of algae and other vegetation. Plants demand oxygen and excessive vegetative growths can cause fish kills. Even though certain types of chemicals are currently prohibited, the problem still exists.

Poor farming techniques, in general, have been detrimental to water resources by resulting in extensive erosion and, ultimately, siltation of waterways. In many instances, tributaries and river channels have become completely silted up, making navigation impossible. The detrimental effects on commerce, recreation, and industry are obvious. Thus, the Agricultural Sector, while not of such comparative significance in terms of size of employment, is of great interest and concern in regard to its effect on the Bay. Irrigation, an important method in some areas of achieving highest yields per acre, is not of special significance in the Study Area. Therefore, it will not be considered here.

Certain counties within the Study Area (e.g., Fairfax County, Virginia) practice effective farming and soil conservation techniques. These include planning for the use of land according to soil types and terrain conditions which allows the farmer to use the land to the best purpose. The banks of waterways are left in sod or forest cover. Steep slopes are not plowed. The most intensive tillage is performed on soils that are level, well-drained and which tend to resist erosion.

Many acres of farmland within the Bay Area will be urbanized in the future. If agricultural lands can be used according to their capabilities, much of the sedimentation and erosion problems which have plagued the Chesapeake Bay Area can be avoided.

b. Forestry. Forestry plays a significantly less important economic role within the Estuary Area than does Agriculture. Before settlement took place, the Region was covered with a rather dense forest cover. In spite of the vast urban nucleations and suburban sprawl which have developed since that time, large woodland areas still remain, particularly in the Tidewater regions of Virginia and southern Maryland. Although as much as two-thirds of the land area of some counties is in

woodlands, Forestry employs a minor proportion of the work force. In addition, woodlands are relatively insignificant in terms of value of products sold.

c. Fisheries. Surprisingly, the Fisheries industry employs only a comparatively small portion of the total work force in the Estuary Area, yet the Chesapeake Bay and its tributaries support one of the major U.S. commercial fisheries industries (this is not to mention the recreational fishing resources of the Bay). More detailed information on the "Harvesting Sector" and the "Seafood Processing Industry" is outlined by the National Marine Fisheries Service in Chapter VI of Appendix C of the Chesapeake Bay Existing Conditions Report.

#### BALTIMORE, MARYLAND SUBREGION

Agriculture, Forestry, and Fisheries employed 24,366 workers in 1970 which represented a 26.3 percent decrease over the number engaged in these activities in 1960. While the Baltimore Subregion employed more people in these three industries than any other Subregion (45.1 percent), the Sector accounted for only 2.4 percent of the total labor force within the Subregion.

In the Baltimore Subregion, Agriculture alone engaged 17,926 people or 73.6 percent of the total employment in this Sector. The value of all farm products sold by commercial farms in this Subregion amounted to \$384,293,000. Caroline, Carroll, Somerset, Wicomico, and Worcester Counties, Maryland, and Kent and Sussex Counties, Delaware, were the primary agricultural producers. Each sold over \$20 million worth of products.

Poultry and poultry products accounted for the major portion of the value of all agricultural products. Wicomico, Worcester, Sussex, and Somerset Counties were the principal poultry producers. Vegetables and dairy products were also valuable groups of agricultural commodities sold in the Subregion. All of the 17 counties of the Subregion produced at least some of these products. Dairying has a definite advantage in the Bay Region because the large urban populations demand fresh bottled milk and cream. The dairies themselves must be within close proximity to meet this demand. Dairying, as a result, has successfully competed with the urbanization process for land immediately adjacent to the cities.

## WASHINGTON, D.C. SUBREGION

There were 12,427 workers employed in the Agriculture, Forestry, and Fisheries Sector in the Washington Subregion in 1970. This was a decrease of 17.8 percent over the number employed in 1960. The Subregion ranked second in terms of number of people engaged in this Sector (23.0 percent of all those within the Estuary Area employed in Agriculture, Forestry, and Fisheries). Of the total labor force within this Subregion, however, only 0.9 percent were engaged in these industries.

Agriculture accounted for almost two-thirds of all those employed in the Sector, or 8,041 people. The value of all farm products sold by commercial farms in this Subregion totaled \$54,969,000. This was only 14.3 percent of the total value of farm products produced in the Baltimore Subregion. In terms of value, livestock and poultry were more valuable in this Subregion than were crops. Tobacco, however, was a very important commodity with the chief producing counties all located in Southern Maryland (Prince Georges, Calvert, Charles, and St. Marys). The total value of the tobacco crop was considerably higher than any other Subregion in the Estuary Area.

Dairy products and the sale of livestock were important farm activities within the Washington, D.C. Subregion as well. Loudoun County, Virginia, was the principal producer of livestock, including cattle, calves, hogs, and pigs. Only one county out of 12 did not produce livestock for commercial sale (Arlington County, a highly urbanized area, was the sole county which did not produce livestock).

## RICHMOND, VIRGINIA SUBREGION

The Agriculture, Forestry, and Fisheries Sector within the Richmond Subregion employed 5,589 people in 1970 which represented 1.9 percent of the total work force in the Subregion. There was a 39.8 percent decrease over the number engaged in this Sector in 1960. The Subregion ranked fourth within the Estuary Area in the number of people employed in these three industries. Approximately 10.3 percent of the total Sector employment was located in the Richmond Subregion. As with the other Subregions thus far investigated,

the Richmond Subregion has more workers employed in the Agricultural portion of the Sector than both Forestry and Fisheries combined. Approximately 70.4 percent of the workers (3,932 people) are involved in some type of farming activity.

The value of all farm products sold by commercial farms totaled \$45,747,000. The most important farm products sold were the oil crops which include soybeans and peanuts. Production and sales took place in all 15 counties of the Subregion. Corn and livestock were also important farm products and were each produced in all of the Subregion's counties.

#### NORFOLK-PORTSMOUTH SUBREGION

The Norfolk-Portsmouth Subregion was the third highest employer within the Estuary Area (15.3 percent of the total) in the Agriculture, Forestry, and Fisheries Sector. Approximately 8,252 people were employed in 1970 representing a decrease of 33.8 percent over those engaged by these industries in 1960. The Sector accounted for only 1.8 percent of the total labor force within this Economic Subregion.

In 1970, Agriculture employed 4,833 workers or 13.2 percent of all those employed in Agricultural activities within the Estuary. The value of all farm products sold totaled \$62,825,000 in 1969 with oil crops making up the largest portion of this. Southampton County was the biggest producer of oil crops in both the Subregion and the Estuary Area. The major portion of oil crops sold by commercial farms in this Subregion was produced in Southampton and Isle of Wight Counties and the City of Suffolk. The Subregion is also an important producer of livestock and corn.

#### WILMINGTON, DELAWARE SMSA

The Wilmington Subregion employed less people in the Agriculture, Forestry, and Fisheries Sector in 1970 than any of the other four Subregions (only 6.4 percent of all those within the Estuary Area employed in this Sector were found here). Employment in 1970 was 3,450, a decrease of almost one-third from the number engaged in these activities in 1960. Of the total work force in the Wilmington SMSA, 1.8 percent were employed in this Sector.

Agriculture in the Subregion engaged 1,954 people or 56.6 percent of the total Sector employment. The value of all farm products sold by commercial farms was the lowest for any of the Subregions. Part of this can be explained by the fact that the Wilmington Subregion is much smaller in area than any of the other Subregions.

The most important group of commodities in terms of value of products sold was dairy products. The explanation for this is similar to that for other large dairying areas: farmlands in close enough proximity to large urban populations to provide the fresh cream and milk which urban population demands.

Each of the three counties within the Subregion (Cecil, New Castle, and Salem) sold between \$2,000,000 and \$4,999,000 worth of dairy products in 1969. The total value of these commodities was \$11,473,000.

Vegetables ranked second in value of farm products sold. Salem County, New Jersey, was the largest producer of vegetables both within the Subregion as well as the Estuary Area, having sold \$9,664,000 worth of products. The total value of these farm products for the Subregion amounted to \$10,432,000. The best explanation for such a large production of vegetables is, once again, the Subregion's location. Situated between several large urban centers (Wilmington, Philadelphia, and New York), the Wilmington Subregion supplies vegetables to an ever increasing market both within as well as outside its economic boundaries. Due to the close proximity of these markets, perishable vegetables can reach the consumer before they have time to spoil.

Poultry products constitute an important commodity sold in the Subregion. All three counties produced these products in 1969.

Nursery and greenhouse products are economically important to the Estuary Area although in no Subregion are these products among the three most important commodities in terms of value of farm products sold. Production is greatest in counties adjacent to or surrounding large urban populations where demand for specialized "horticulture - type" goods is strongest.

## CONSTRUCTION

The Construction Sector (SIC Code 15-17) includes workers engaged in contract construction. Activities in this Sector include the construction of houses, office buildings, stores, highways, bridges, tunnels, locks, piers, dams, as well as more specialized construction jobs such as plumbing, painting, electrical work, and carpentry.

The Construction Sector in the Estuary Area employed 199,723 people in 1970. This represented a 22.3 percent increase over the figure for 1960. About 6.1 percent of the Area's work force was employed in this Sector, slightly higher than the figure for the United States as a whole.

The level of construction activity in the Bay Region increased significantly between 1960 and 1970 as evidenced by the increase of some 36,000 workers during the period. An increase in housing construction was a major reason for this expansion, as shown in Table 3-25. The tremendous influx of new people into the Region during the last decade significantly increased the demand for new housing. Generally, one new housing unit (including apartments) was built for each two to three person change in the population during the 1960-1970 decade. In addition, postwar babies reached the age when they began to form families and buy homes. Expanded government aid in the area of subsidized housing and mortgages has also helped to stimulate the housing industry. As a result of these factors, there was an increase of 584,384 housing units in the Bay Region during the 1960-1970 period.

As might be expected, housing construction activity in the Estuary Area was generally concentrated in those counties which experienced the highest gains in population. These included the counties around Washington, D.C. and Baltimore, Maryland. Prince Georges County, Maryland, had, by far, the largest absolute increase in housing units during the decade with a gain of 100,612 units. The Washington, D.C. Subregion alone accounted for approximately 53 percent of the total increase in housing units in the Bay Region during the Sixties. The Baltimore Subregion accounted for an additional 23 percent. Table 3-25 and Figure 3-17 present data for the increases in housing units in the Estuary Area by Subregion and county during the decade.

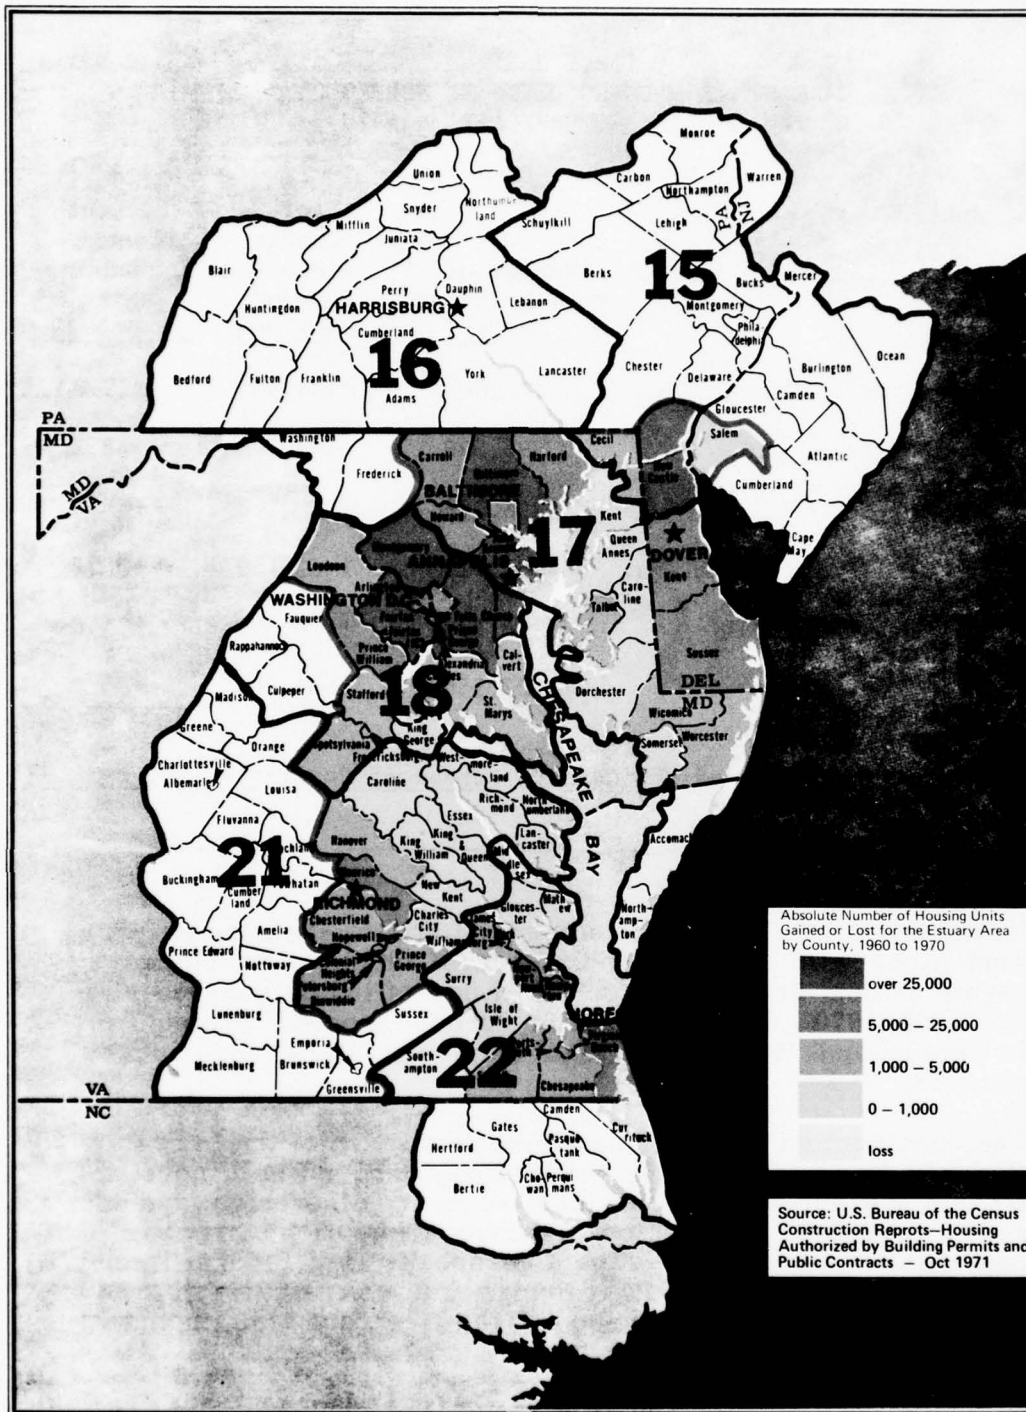

FIGURE 3-17

Total Estuary Area	2,537,950	+584,384	+29.9

SOURCE: U.S. Bureau of the Census, Census of Housing: 1960 and 1970.

Increases in business and commercial activities in the Estuary Area along with expansions in Federal employment helped to create a boom in the construction of new office buildings during the 1960-1970 decade. Major urban renewal projects in Baltimore and Washington also employed many construction workers.

The construction of the Estuary Area's portion of the Interstate Highway System, including the Beltways around Baltimore and Washington and the improvement of many other highways and roads throughout the Region provided a significant number of jobs during the decade. The Chesapeake Bay Bridge-Tunnel project and the second Bay Bridge between Sandy Point and Kent Island in the Northern Part of the Bay were also important projects.

Construction activities have a great deal of impact on the water resources of the Bay Region. Much of the disturbed soil (often including valuable top soil) in construction areas erodes and becomes sediment in streams and rivers. This silt causes damage to fish and wildlife by cutting-down on the amount of

oxygen in the water and by covering spawning beds. In addition, sediment can clog navigation channels (necessitating costly dredging operations), increase the cost of treatment for city and industrial water supplied, increase flood damages, make water recreation less enjoyable, and generally lower the aesthetic quality of a waterway. The indiscriminant cutting of trees, paving of land, and the destruction of wetlands during construction activities greatly increases the run-off from a given rainfall which, in turn, increases the frequency and severity of floods.

Unfortunately, the areas in the Bay Region with the most construction activity are the same areas in which there are already significant industrial and residential strains on the Bay's resources. It was estimated in a study by Wolman that sediment from construction sites in the Washington, D.C. area probably contributes 25-30 percent of the total sediment entering the Potomac River at Washington. These facts only emphasize the need for a comprehensive land and water management program which will minimize the environmental impact of these activities.

#### BALTIMORE, MARYLAND SUBREGION

There were 63,836 people working in the Construction Sector in 1970 in the Baltimore Subregion. The Subregion ranked second in the Estuary Area in employment in this Sector with 32.0 percent of the Region's total. There was a gain in employment of 10.2 percent during the 1960-1970 decade, the smallest increase of any Subregion.

Housing and apartment construction accounted for a major part of the building activity in the Subregion. The net gain of 134,457 housing units between 1960 and 1970 represented about 23 percent of the total Estuary Area gain. The major portion of this activity took place in the counties which comprise the Baltimore SMSA. Baltimore and Anne Arundel Counties along with Baltimore City experienced the greatest absolute gains with increases of 47,824, 27,574, and 15,366 units respectively between 1960 and 1970. Howard County, Maryland, had the greatest percentage increase (76.9 percent) of any county in the Subregion largely due to the presence of the planned community of Columbia between Baltimore and Washington. On the Eastern Shore, significant construction activity took place in Worcester and Sussex Counties along the Atlantic Ocean beach areas from Rehoboth Beach, Delaware, south to Ocean City, Maryland.

There were also several important highway construction projects in the Subregion during the decade. The construction of Interstate Highways 95, 83, and 70N, as well as the improvement of U.S. Routes 50, 13, and 113 provided many jobs during the decade.

The Calvert Cliffs Nuclear Power Plant and the second Bay Bridge were also important projects during the latter part of the period.

#### WASHINGTON, D. C. SUBREGION

The Washington Subregion ranked first in the Estuary Area in Construction Sector employment with 74,849 workers in 1970. This amounted to 37.5 percent of the total construction employment in the Estuary Area. The area experienced a higher than average employment increase of 28.2 percent during the Sixties.

Approximately 53 percent of the total increase in housing units during the 1960-1970 decade in the Estuary Area occurred in this Subregion. Again the vast majority of the housing construction activity took place in the suburban counties surrounding the District of Columbia. Prince Georges and Montgomery Counties in Maryland and Fairfax County, Virginia, had the highest absolute increases in the Subregion with gains of 100,612, 64,237, and 61,633 housing units respectively. Suburbanization has spread outward from the District of Columbia into Prince William, Loudoun and Charles Counties. Prince William had the highest percentage increase of any county in the Estuary Area (+126.3 percent) during the 1960-1970 decade.

A proposed new community in Charles County, Maryland (St. Charles) has sparked a controversy between present residents of the County and outside developers. The dispute arose over the fact that the new community will eventually almost double the population of what is now a predominantly rural county. Residents fear that such rapid development will permanently alter the quaint, rural life which they have been used to. Such conflicts between the need for more land for development and the desire to preserve unique lands and life styles again point out the need for a comprehensive land and water management plan for the Bay Region.

The construction and improvement of Interstate Highways 95, 66, 70S, 495, and U.S. Routes 29, 50, and 301 generated a

significant number of jobs for construction workers during the 1960-1970 decade. The construction of Dulles International Airport in Loudoun County, Virginia, was also important to the Sector. Expanded Federal employment in the Washington area stimulated the construction of many new office buildings.

#### RICHMOND, VIRGINIA SUBREGION

There were 21,317 people employed in the Construction Sector of the Richmond Subregion in 1970. The Subregion ranked first in the Estuary Area in proportion of total workers in the Construction Sector with 7.1 percent. The rate of employment increase during the 1960-1970 decade amounted to 27.1 percent, higher than both the National and Regional rates.

There was a net gain of over 50,000 housing units in the Subregion during the last decade. This represented a 26.8 percent increase during the period, the second highest gain in the Estuary Area. The political subdivisions with the largest absolute gains in the Subregion were Richmond City and Henrico County. These two counties accounted for about 66 percent of the total net gain in housing units. None of the counties or independent cities in the Subregion lost housing units during the decade. All of the counties in the Richmond-Petersburg area experienced moderate percentage gains with Henrico (+42.6 percent), Hanover (+41.7 percent), and Prince George (+38.9 percent) experiencing the highest proportional increases.

Many construction workers were also employed during the decade in expansion and improvement of Interstate Highways 95, 64, 85, and U.S. Routes 360, 60, and 301. The increased demand for office space, due to large gains in the number of State government employees, also stimulated construction activity in the Richmond area.

#### NORFOLK-PORTSMOUTH, VIRGINIA SUBREGION

There were 26,196 workers in the Construction Sector in the Norfolk-Portsmouth Subregion in 1970. There was an increase in employment during the 1960-1970 decade of 31.8 percent, the largest increase in the Estuary Area. This gain was due

to a significant influx of Armed Forces personnel into the area and to a large increase in the construction of vacation homes in the Virginia Beach area.

The gain of 62,412 housing units in the Subregion during the 1960-1970 decade represented an increase of 22.7 percent. The largest absolute increase occurred in the Independent Cities of Hampton, Newport News, and Virginia Beach. These three political units accounted for 69 percent of the total increase in housing units in the Subregion. Virginia Beach experienced the largest percentage increase in the Subregion with a gain of 92.8 percent. York and James City Counties also had large proportional increases with gains of 46.2 percent and 70.2 percent respectively. Suffolk (-12.1 percent) and Southampton (-27.7 percent) Counties were the only ones with losses during the decade in the Subregion.

The construction of the 21-mile-long Chesapeake Bay Bridge-Tunnel across the mouth of the Bay was the major construction project in the Subregion during the Sixties. The construction and improvement of Interstate Highways 64 and 264, U.S. Routes 58 and 17, along with State Road 44 to Virginia Beach, also stimulated construction activity in the area.

#### WILMINGTON, DELAWARE SMSA

The Wilmington SMSA had 13,527 Construction workers in 1970. The Subregion ranked second in the Estuary Area in both proportion of total workers in the Construction Sector and in percentage increase in Sector employment.

The area experienced an increase of 28,097 housing units during the 1960-1970 decade with all but about 2,000 of this increase occurring in New Castle County, Delaware.

There were several highway construction and improvement projects in the SMSA during the decade including Interstate Highways 95 and 295 as well as U.S. Routes 40 and 13. The construction of a second bridge crossing over the Delaware River was also an important construction project in the Subregion during the decade.

## MINING

The Mining Sector includes quarrying and gas and petroleum extraction as well as general mining activities (SIC Codes 10-14). Mining in 1970 provided employment for 3,414 people or 0.1 percent of the total employment in the Estuary Area. This represented an increase between 1960 and 1970 of 71.1 percent. In the United States as a whole, Mining employment declined 7.6 percent during the same period and it accounted for 0.8 percent of the total National employment in 1970.

In 1970, Mining employed fewer people than any other Sector within the Estuary Area. The same is true for each of the individual Subregions where employment in this Sector accounted for no more than 0.2 percent of the total. The chief reason for such a small employment rate in mining is simply a general absence of most minerals in any commercially significant quantities. Only stone, sand, gravel, and clay are found in large enough quantities to provide significant employment. These commodities are used, for the most part, as building materials for local construction projects. As a result, the demand for these materials has increased right along with the tremendous increases in construction activity throughout the Bay Region. Baltimore, Harford, Howard, Anne Arundel, Montgomery, Prince Georges, and Fairfax Counties have experienced especially heavy building activity. The construction of highways, beltways, and other road construction and maintenance, along with the construction of such projects as the Baltimore Gas and Electric Company's nuclear power plant at Calvert Cliffs, also use large quantities of sand, gravel, stone, and clay.

Although the Mining Sector employs relatively few people in the Estuary Area, Mining activities can have significant impacts on the environment and the water resource planning process. A major part of the sand and gravel produced in the Bay Region is extracted from river bottoms by dredging operations. These activities obviously stir-up bottom materials causing aesthetic degradation of the rivers due to clouding and silting and damaging finfish and shellfish populations. The operation of quarries, the major method of extracting stone and clay in the Bay Region, can also cause environmental problems associated with erosion, acid mine drainage, and aesthetics.

## BALTIMORE, MARYLAND SUBREGION

As of 1970, the Baltimore Subregion employed 984 people which represented 10.2 percent more than those employed in 1960. Baltimore ranked second within the Estuary Area in terms of numbers engaged in Mining. Approximately 28.8 percent of all those employed in this Sector within the Estuary Area are located in the Baltimore Subregion.

Six commodities constitute the chief economic products mined or quarried within the Baltimore Subregion. Sand and gravel, quarried in largest quantities in Baltimore and Anne Arundel Counties, are used for local construction. Limestone, one of the most valuable stone products, is used both as a building stone as well as in the making of cement. Primary limestone producing areas include Baltimore, Howard, and Carroll Counties. Crushed and dimension stone are also mined for local use. Dimension stone, used for building purposes, includes marble, gneiss, slate, quartzite, and serpentine. During the 1960-1970 decade, it was most often quarried in Baltimore and Harford Counties. Clay, a fourth mineral of economic value, is also prevalent in Harford and Baltimore Counties. It is used to make brick and tile for construction and in pottery. Two other commodities are mined within the Baltimore Economic Subregion. A peat bog in Kent County, Maryland, provided material which was processed and sold in bulk or packaged for general soil improvement. The last commodity, oyster shells, are dredged from the bottom of the Bay and its tributaries, ground up and used as diet supplement in the poultry industry of the United States. These crushed oyster shells provide a mineral, calcium carbonate, which is important in strengthening the shell of the chicken egg.

## WASHINGTON, D. C. SUBREGION

In 1970, employment in Mining for the Washington Subregion totaled 1,313, an increase of 96 percent between 1960 and 1970. The area employed a higher percentage of the total Regional Mining employment (38.5 percent) than any other Subregion. The majority of those employed come from those areas which have experienced the greatest building and road construction growth: Prince Georges, Montgomery, and Fairfax Counties, and Washington, D.C.

While the Subregion has no deposits of coal, metals or fuels, it is reasonably well supplied with sand and gravel and a small amount of stone. Charles, Fairfax, and Prince Georges Counties are the principal sand and gravel producing areas. Much of this fine and coarse grained mixture is taken from the bed of the Potomac River. The Maryland General Assembly has partially altered this dredging operation, however, by passing a bill in March of 1971 which made it "unlawful to dredge for sand, gravel, or other aggregates or minerals, in any of the tidal waters or marshlands of Charles County, providing that this section should not conflict with any necessary channel dredging operation for the purposes of navigation." Thus, all mining of sand and gravel in the Potomac under the jurisdiction of Charles County, Maryland, has been suspended since July 1, 1971 when the new law took effect.

There were minor deposits of marl and greensand found in Calvert County which were sold for agricultural purposes. Diatomite, supplemented with additional stockpile material and used for experimental purposes was also found and produced in Calvert County.

Fairfax, Prince William, and Loudoun Counties quarry dimension stone (granite and traprock). In addition, Fairfax County produces crushed stone (granite) which is used in construction or as agstone, fluxstone, railroad ballast, riprap and stone sand.

#### RICHMOND, VIRGINIA SUBREGION

The Mining Sector in the Richmond Economic Subregion employed 606 people in 1970. This represented an increase of 242.4 percent over the number employed in 1960. Only 0.2 percent of the total work force in the Subregion was engaged in Mining representing 17.8 percent of the total Mining activity within the Estuary Area.

Sand and gravel, together with brick clay, are produced and used for local construction purposes. The bulk of the sand and gravel recovery was by dredging and open pit mining. A substantial tonnage of industrial silica sand was produced from crushed sandstone and quartzite. Henrico County was one of the leading producers within the Subregion as well as within the Chesapeake Bay Estuary as a whole. Chesterfield and Charles City Counties were two of the other principal sand and gravel producing areas.

Clay output was in large part responsible for the increase in employment in the Mining Sector of the Richmond Subregion. Most of this clay is used for brick manufacture and to a lesser degree as lightweight aggregate and in the manufacture of Portland cement. A small amount is used in the making of flue linings, pottery, clay dummies, and sewer pipe. Chesterfield is the chief clay producing county in the Subregion.

The significant stone producing areas of the Subregion include Hanover and Chesterfield Counties. They are important for the production of crushed stone.

#### NORFOLK-PORTSMOUTH SUBREGION

The Mining Sector in the Norfolk-Portsmouth Subregion employs only 268 people. While this is a relatively insignificant number, it does represent an increase of 155 percent over the number employed in 1960. Of the total number of persons engaged in Mining in the Estuary Area, only 7.9 percent are located within this Subregion.

Chief mining activities consist of sand and gravel quarries and oyster shell mining. Sand, most of which is found in Virginia Beach near the Atlantic Ocean, is of sufficiently high quality and quantity that some of it is shipped outside the Subregion. Oyster shells are produced by two firms in the area and are utilized as raw materials for lime and the manufacture of cement. Oyster shell quarrying has been on the increase and this trend is expected to continue.

Several operations in Nansemond County mine clay for use by potters and in the production of lightweight aggregate. This clay is generally not of high enough quality to be useful in making the better clay products.

#### WILMINGTON, DELAWARE SMSA

In 1970, there were only 243 people, or 0.1 percent of the working population engaged in Mining activities in the Wilmington SMSA. While this was a 62 percent increase between 1960 and 1970, it represented the least number of people in the

Mining Sector of any of the five Economic Subregions (7.1 percent of all workers in the Estuary Area involved in mining were located in the Wilmington SMSA).

Mining activities which exist in this Subregion consist of sand, gravel, and stone quarrying in Cecil County, Maryland, and sand, gravel, and clay quarrying in New Castle County, Delaware. One of the best known granite deposits in the Bay Area is found near Port Deposit in Cecil County. It is used in widespread areas of the East Coast as both a building stone and as crushed stone for the construction of roads. Limestone and marble, two other building stones, are also mined in this County. Marble is especially valuable in gracing monuments and facades of churches and other institutions. The terrace and stream beds of Cecil County yield substantial quantities of sand and gravel. Most of this is used locally in highway construction and for building purposes.

New Castle County quarries no significant amounts of stone. Clay production, however, is used in the manufacture of common red brick.

#### WHOLESALE AND RETAIL TRADE

The Wholesale and Retail Trade Sector includes employment in the following activities:

- a. Wholesale trade (SIC codes 50 and 51);
- b. Building materials, hardware, garden supply, and mobile home dealers (SIC code 52);
- c. General merchandise stores (SIC code 53);
- d. Food stores (SIC code 54);
- e. Automotive dealers and gasoline service stations (SIC code 55);
- f. Apparel and accessory stores (SIC code 56);
- g. Furniture, home furnishings, and equipment stores (SIC code 57);
- h. Eating and drinking places (SIC code 58);
- i. Miscellaneous retail (SIC code 59).

There were 565,196 workers employed in this Sector in 1970 or about 17.2 percent of the total employment in the Estuary

Area. This was lower than the National rate of 23.9 percent. In 1970, Wholesale and Retail Trade activities were the second largest employer in the Bay Region, behind the Service Sector. The Sector grew by 35.3 percent during the 1960-1970 decade, significantly higher than the National gain of 23.9 percent. The Wholesale Trade category grew the fastest with an increase of 63.6 percent compared to 30.1 percent for Retail Trade.

Retail Trade activities thrive in areas with high concentrations of people, high incomes, easy automobile accessibility and attractive surroundings. Since the Bay Region has an abundance of these characteristics, the Retail Trade industry is well-developed. It employs 458,221 workers or about 31 percent of the total Sector employment. Nationally, Retail Trade accounts for approximately 74 percent of total Wholesale and Retail Trade employment.

Half a century ago the inner cities were the undisputed centers of retail trade activities. During the 1920's, however, many retail trade establishments began to move out of the inner cities along with the many higher income families who were fleeing the city environment. More recently, the development of modern highway systems around the cities has led to the establishment of large shopping centers in the suburban counties. These counties have captured an increasing share of the retail sales in the Bay Region during the last several decades. However, as Figure 3-18 illustrates, the major cities are still important retail centers.

The Washington, D.C. and Baltimore, Maryland SMSA's contain the bulk (about 65 percent) of the retail trade activity in the Estuary Area. Other important retail centers are located in Richmond City, Wilmington, and in the Hampton Roads area of Virginia.

In 1970, about 19 percent of the total Wholesale and Retail Trade employment or 106,975 workers were engaged in wholesale activities. Persons are counted as being employed in the Wholesale Trade industry when they sell to, or negotiate sales with, persons who buy for the purposes of resale or industrial use. Wholesalers usually operate from warehouses which serve as storage facilities for their large stocks of goods. Sales negotiations are usually carried on at the retailer's establishment. Attractive surroundings are therefore not an absolute requirement for wholesalers since the availability of good transportation facilities, including water, is highly desirable. Because of the bulk quantities involved, the inner cities have remained the focal points of wholesale trade in the Estuary. Figure 3-19 illustrates this point. Table 3-26 shows the importance of various products in the wholesale trade

industry for the major SMSA's in the Bay Region. These major SMSA's control the bulk of the wholesale business with about 94 percent of the total 1972 sales in the Bay Region.

Wholesale trade in an area will often revolve around goods (manufactured or agricultural) which are produced in that area. For example, Baltimore specializes in the wholesaling of metal and metal products, Wilmington in drugs and chemicals, and Richmond in raw farm products (including tobacco auctioning and warehousing). Since the producing Sectors (Manufacturing, Agriculture, and Mining) of the Estuary Area's economy are relatively small, the wholesale trade industry is not well-developed in the Region. Some goods intended for wholesale distribution within the Bay Region are shipped into the Area from plants located outside the Region for re-distribution to retailers within the Estuary Area. Automobiles and auto accessories are examples of such goods.

#### BALTIMORE, MARYLAND SUBREGION

There were 188,128 persons employed in the Wholesale and Retail Trade Sector of the Baltimore Subregion in 1970. This amounted to 33.3 percent of the total Sector employment in the Estuary Area. Employment rose by 26.2 percent during the 1960-1970 period, lower than the total Estuary Area rate but higher than the National figure. There was a total of \$12.7 billion worth of wholesale and retail trade sales in the Subregion according to the 1972 Census of Wholesale Trade and Retail Trade. The Wholesale and Retail Trade industry was the third largest employer in the Baltimore Subregion in 1970 with 18.7 percent of the total workers. The majority of this employment (79.2 percent) was engaged in Retail Trade activities. Employment in this category increased by 46.1 percent during the 1960-1970 decade. Major retail trade centers on the Western Shore are located in Baltimore City, Annapolis, Bel Air, Westminster, and in numerous locations around the Baltimore Beltway in Baltimore and Anne Arundel Counties. On the Eastern Shore, the major retail trade centers are located in Salisbury, Maryland, and Dover, Delaware. Retail Stores in Salisbury advertise their services as far as 75 miles away. There is also some important seasonal activity along the ocean beach resorts in Sussex and Worcester Counties, and in numerous fishing, boating, and swimming areas along the Bay's shoreline. Many thousands of dollars have been lost because of beach closings due to high pollution levels. This is especially true in the Baltimore County area where most of the private and public beaches have been closed.

Although the Wholesale Trade industry employs only 20.8 percent of the workers in this Sector, the majority of the sales (about 55 percent in 1972) took place in this category. Wholesale trade employment increased by 57.2 percent between 1960-1970. The important wholesaling centers are located in Baltimore City and the surrounding counties and in Sussex and Wicomico Counties where the wholesaling of farm products (especially poultry) is important.

The Baltimore SMSA accounted for 90 percent of total wholesale sales in the Subregion. The most important commodities wholesaled were groceries, metals, minerals, machinery, petroleum and petroleum products, and motor vehicles and automotive equipment. The latter two activities rely heavily on the port facilities of Baltimore. The City is the leading importer of foreign cars in the Country and is an important distributor of these automobiles. The City is also an important distributor of petroleum and petroleum products which are shipped through the C & D Canal from the refineries along the Delaware River and then redistributed to various points in the Bay. The majority of the metal and machinery wholesaled in the Subregion are produced in the Baltimore area.

#### WASHINGTON, D. C. SUBREGION

The Wholesale and Retail Trade Sector employed 209,050 workers in 1970 or 37.0 percent of the total Sector employment in the Estuary Area. The Subregion ranked first in the Bay Region in numbers employed in this Sector. The number of workers increased by 51.7 percent, significantly higher than both the Regional and National rates. Total wholesale and retail sales in 1972 were \$15.0 billion in the Subregion.

The Wholesale and Retail Trade industry employed 15.7 percent of the Subregion's work force in 1970 making it the third leading employer in the Subregion. About 82.3 percent of those working in this Sector are engaged in retail trade activities. Employment in this category increased by 46.1 percent during the decade in the Subregion as rising population and income greatly increased the demand for retail services. As was the case in Baltimore, large shopping centers located at convenient places in the suburbs, usually near the Beltway, handle an increasing share of the retail trade business. However, the large numbers of government employees located in the downtown area has tended to keep retail trade in the city thriving.

Important retail centers within the Subregion besides the District of Columbia are Arlington, Alexandria, Fairfax City, Falls Church, and Fredericksburg in Virginia. In Maryland, Rockville, Hyattsville, and Laurel are also well-developed retail trade centers.

Wholesale Trade activities employed 34,140 workers in 1970 or 16.3 percent of the total Sector Workers. The industry accounted for approximately \$7.3 billion worth of sales in 1972, the largest amount of any subregion. The most important goods wholesaled are electrical and non-electrical machinery, motor vehicles, and groceries. Distribution outlets of National and Regional manufacturing firms located in the Subregion to serve the large, high-income population generate a large part of the employment and sales in the Wholesaling category.

#### RICHMOND, VIRGINIA SUBREGION

There were 58,438 workers employed in the Wholesale and Retail Trade Sector in the Richmond Subregion in 1970. The Subregion employed 10.3 percent of the total Bay Region workers in this Sector. Employment increased by 25.5 percent during the 1960-1970 period, with Wholesale Trade having the highest rate of growth. This increase was slightly higher than the National rate but lower than the Regional rate. Total wholesale and retail sales in the Subregion in 1972 were approximately \$5.1 billion.

The Richmond Subregion employed the highest percentage of its workers in the Wholesale and Retail Trade Sector (19.4 percent) than any other Subregion. Retail trade employs 75.3 percent of the workers in this Sector. Over half (53 percent) of the retail goods sold in the entire Subregion were sold in Richmond City. As was the case in Washington, D.C., retail trade in the City has been stimulated by the concentration of relatively high-income Government workers in the downtown area. Other significant retail trade activity is located in the Richmond suburbs and in Petersburg and Hopewell.

The Wholesale Trade industry is well-developed in the Richmond Subregion. Employment in this category rose by 54.3 percent during the 1960-1970 decade. The City serves as the major distribution center for groceries and motor vehicles for a large hinterland. The relative importance of manufacturing in the Subregion also makes the distribution of machinery and metals important. Richmond's port facilities also help to make

the City a wholesale supplier of petroleum and petroleum products. The wholesaling activity for which the Richmond area is most noted for is the auctioning and warehousing of tobacco.

#### NORFOLK-PORTSMOUTH, VIRGINIA SUBREGION

There were 73,946 persons employed in the Wholesale and Retail Trade Sectors in 1970. This number represents 13.1 percent of total Sector employment in the Estuary Area. Employment in the Sector rose at a modest 24.3 percent during the 1960-1970 decade. This was just slightly higher than the National increase. There was a total of \$4.3 billion worth of wholesale and retail trade sales in the Subregion in 1972.

The Sector was the third largest employer in the Subregion in 1970 accounting for 15.9 percent of the total Subregion workers. A large proportion of these workers, 82.3 percent, are engaged in Retail Trade activities. About \$2.3 billion worth of retail business took place in the Subregion in 1972. Retail trade employment increased by 23.1 percent during the 1960-1970 decade.

The relative importance of the Retail Trade is due to the large contingent of Armed Services which are stationed in the area. The income they receive, although some is spent in PX facilities, substantially increases the demand for retail services in the Subregion. Over one-third (35 percent) of the retail sales in the entire Subregion are transacted in Norfolk City. Other significant retail centers are located in Portsmouth, Hampton, and Newport News. There is also some important seasonal retail activity in Virginia Beach City along the ocean beaches and in historic Williamsburg which is a major tourist attraction.

Significant wholesale trade activities in the Subregion are limited to the distribution of automobiles and groceries. This can be largely attributed to the relative unimportance of manufacturing activity other than shipbuilding in the Subregion, and the relatively small hinterland for which Norfolk serves as a distribution center. The port facilities at Hampton Roads make the wholesaling of petroleum important. Norfolk also dominates wholesale sales activity in the Subregion with almost 46 percent of the total sales. Other important centers for wholesale trade are Newport News, Hampton, Suffolk, Chesapeake City, Franklin, and Virginia Beach City.

## WILMINGTON, DELAWARE SMSA

In 1970, 35,634 people were employed by the Wholesale and Retail Trade Sector. This equaled 6.3 percent of the total Sector workers in the Bay Region. Employment increased by 43.5 percent in the Sector between 1960 and 1970, faster than both the National and Regional rate. Wholesale and Retail Trade totaled almost \$3.6 billion in 1972.

The Sector employed 18.1 percent of the Subregion's total work force in 1970. High incomes and high rates of population growth in the Wilmington area have helped to stimulate growth in the retail trade industry which grew 36.4 percent during the 1960-1970 period. Wilmington is by far the most important retailing center in the area. Newark, Delaware; Elkton, Maryland; and Salem and Penn's Grove, New Jersey, are of lesser importance.

Although only 17.4 percent of the workers are engaged in wholesale trade activities, about 62 percent of the total Sector sales originated in this industry. The Chemical industry dominated wholesale trade activities in the SMSA in 1970 just as it dominated manufacturing activity. The major chemical firms operate sales branches devoted to the wholesaling of their products. Machinery, groceries, and petroleum and petroleum products are also important in the wholesale trade industry.

## ARMED FORCES

The Armed Forces Sector includes persons on active duty with the United States Army, Air Force, Navy, Marine Corps, or Coast Guard. In 1970, there were 249,403 Armed Forces members stationed within the Estuary Area, representing 7.6 percent of the total Estuary employment. This was an increase of 18.3 percent over the number stationed in the Area in 1960. Four out of the five Subregions registered gains in this Sector. Figure 3-20 shows the percentage of total Estuary Area Armed Forces employment by county and independent city. The Cities of Norfolk and Virginia Beach in the Hampton Roads Area and Anne Arundel, Prince Georges, and Fairfax Counties in the Washington, D.C. Region contained the largest percentages of military personnel.

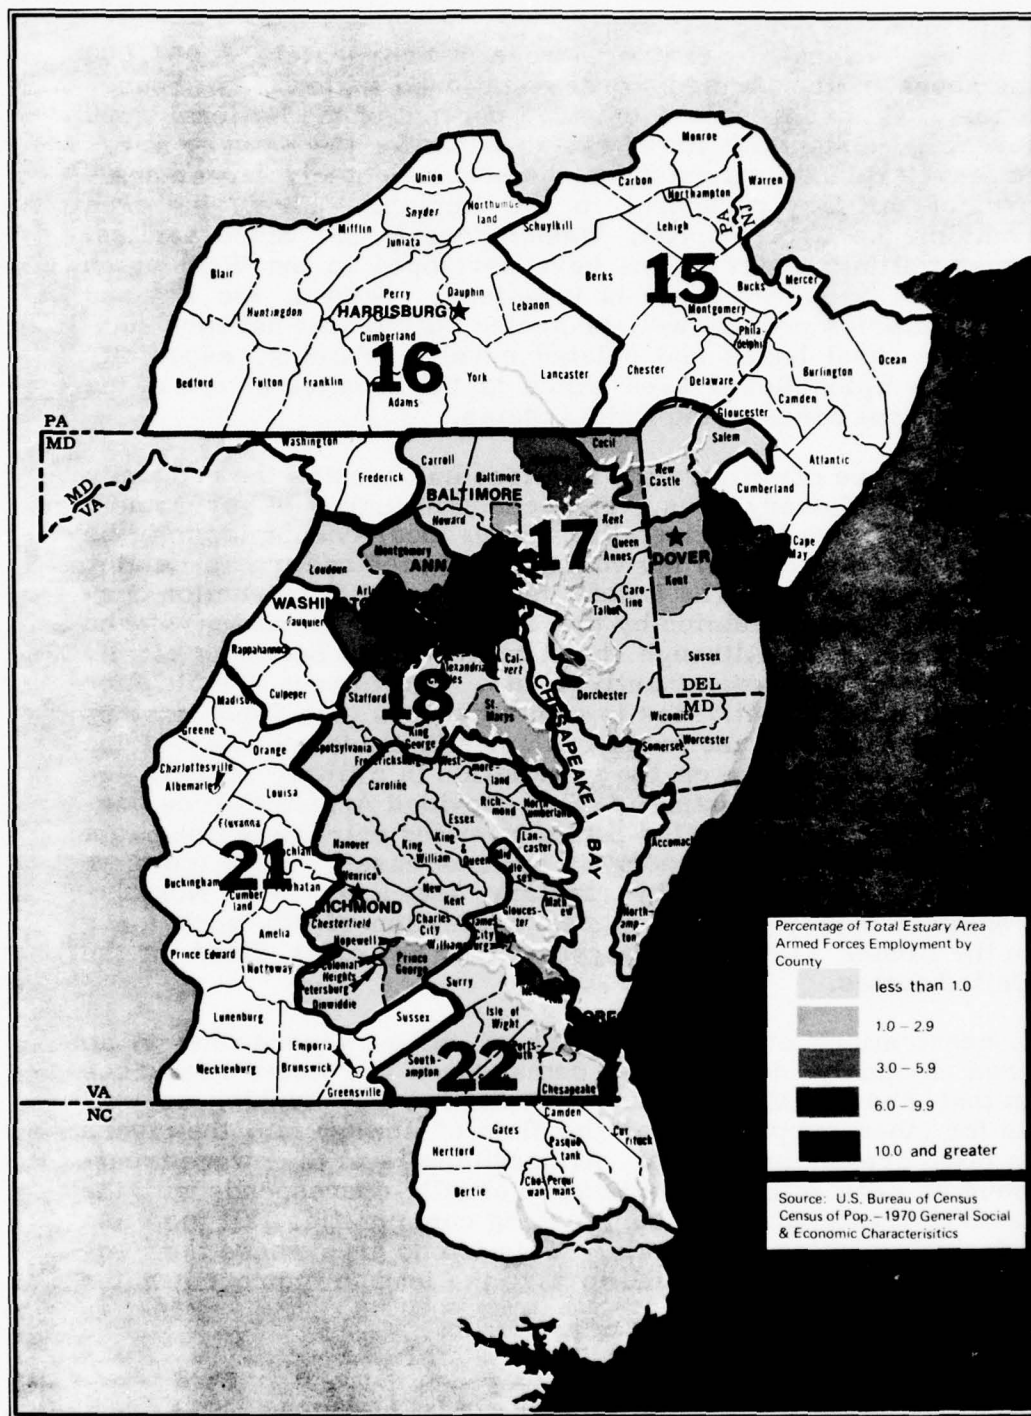

FIGURE 3-20

On the National level there were approximately 1,954,000 members of the Armed Forces stationed within U.S. boundaries. This represented only 2.6 percent of the National work force, a substantially lower rate than that for the Estuary Area. Several explanations exist for the proportionately larger numbers of military personnel in the Region. First, the area contains the U.S. Capital, Washington, D.C. Since earliest times military reservations have developed in the Washington area as a deterrent towards invasions. Second, the Bay and its tributaries provide well-protected, deepwater harbors suitable for naval bases and related naval operations, especially in the Hampton Roads area which is the location of one of the major naval bases in the United States.

The presence of military installations has boosted the economic base of the Estuary Area. The economic impact of government spending for military installations on local economies may be substantial because of the volume of subcontracting associated with this spending. The Retail, Service, and Construction Sectors are also stimulated by the spending of members of the Armed Forces. Although the Armed Forces Sector is rightly considered as predominantly basic, the impact ("multiplier effect") of these activities is somewhat less than those in other basic Sectors because much of the retail trade spending by the military takes place on the installation in military stores. In addition, military housing is often provided Armed Forces personnel. Nevertheless, the Sector remains extremely important to the Bay Region's economy. In some cases, whole towns or areas are supported by military spending. The Norfolk-Portsmouth SMSA has a higher proportion of its work force in the Armed Forces (40 percent) than any other SMSA in the United States.

Concentrations of large numbers of military personnel in an area obviously increase the demands on the water resources in that area. More water is demanded for drinking as well as for other purposes, and the flow of sewage into the rivers is often greatly increased. Although the level of sewage treatment at each military installation usually corresponds with the level of treatment in the surrounding communities, all too often this treatment is inadequate. This is one area where the Federal Government has failed to take the lead in improving water quality.

## BALTIMORE, MARYLAND SUBREGION

The Baltimore Subregion had 35,383 people in the Armed Forces in 1970, representing a slight increase of 2.6 percent over the number stationed there in 1960. Of the total number of people within the Estuary Area in the Armed Forces Sector, 14.2 percent were based in the Baltimore Subregion. Table 3-27 lists the major Federal installations in the Estuary Area by Subregion. The large number of installations present is a result of the area being close to Washington, D.C., and the availability of shoreline sites on the Bay and its tributaries.

## WASHINGTON, D. C. SUBREGION

The Washington Subregion had 90,394 persons in the Armed Forces Sector in 1970. This was the second highest Subregion total and accounted for 36.2 percent of the total Sector employment in the Estuary Area. The number registered in 1970 represented 6.8 percent of the total work force. The large number of installations is due to the location of the Nation's Capital in the Subregion and to the availability of waterfront sites.

## RICHMOND, VIRGINIA SUBREGION

The Richmond Subregion has relatively few members of the Armed Forces based within its boundaries. Approximately 10,201 people or 3.4 percent of the Subregion's work force were listed in this Sector, representing 4.1 percent of the total number of Armed Forces within the Estuary Area. Nevertheless, the number stationed here has increased by almost one-third over those based in the Subregion in 1960, making it the highest percent increase of any Subregion within the Estuary Area. Most of the installations in the area are training facilities.

## NORFOLK-PORTSMOUTH, VIRGINIA SUBREGION

The Norfolk-Portsmouth Subregion provided employment for 108,959 people in the Armed Forces in 1970. This amounted to 43.7 percent of all the Armed Forces personnel in the Bay Region. Almost one in every four members of the work force (23.5 percent) was in the Armed Forces. Several factors are responsible for the presence of this large number of military personnel. The existence of many excellent shoreline sites, as well as the area's proximity to the ocean, has been largely responsible for the location of several large Naval bases. The area has also developed a large shipbuilding industry which has complemented naval operations (and vice versa).

## WILMINGTON, DELAWARE SMSA

There were 4,466 Armed Forces personnel based in the Wilmington Subregion in 1970 representing about 2.3 percent of the area's work force. Of all those employed in this Sector in the Estuary Area, only 1.8 percent were located in this Subregion. This was the only Subregion which has a smaller percentage of its work force engaged in the Armed Forces than the United States as a whole.

Two of the three counties of the Wilmington Subregion contained no military installations. Only Cecil County, Maryland, maintained installations, one at Bainbridge (U.S. Naval Training Center) and the other at Perryville (Perryville Veterans Administration Hospital).

## TRANSPORTATION, COMMUNICATIONS, AND PUBLIC UTILITIES

The Transportation, Communications, and Public Utilities Sector includes employment in the following activities:

- a. Railroad transportation (SIC 40);
- b. Local and suburban transit and interurban highway passenger transportation (SIC 41);
- c. Motor freight transportation and warehousing (SIC 42);
- d. Water transportation (SIC 44);
- e. Transportation by air (SIC 45)
- f. Pipelines, except natural gas (SIC 46);
- g. Transportation services (SIC 47);
- h. Communication (SIC 48);
- i. Electric, gas, and sanitary services (SIC 49).

There were 204,412 people employed in this Sector in 1970. This amounted to 6.2 percent of the Region's work force, just slightly lower than the National proportion. Employment in this Sector grew by 20.3 percent during the 1960-1970 decade, also higher than the National figure. Table 3-28 presents information on employment by Subregion in this Sector.

Historically, the economic development of the Estuary Area has been largely based on the natural transportation and communications network provided by the Chesapeake Bay and its tributaries. Transportation and communications systems have become increasingly complex since colonial times when 500 ton sailing ships with 10 to 15 foot drafts plied the Bay and when messages were sent between towns by horse or by boat. However, water-based transportation has remained extremely important to the Bay Region's economy. A total of approximately 150 million short tons of cargo was shipped on the Chesapeake Bay during 1970. Most of this freight (81.8 percent) passed through the ports of Baltimore (51 million short tons) or Hampton Roads (71 million short tons). About 70 percent of the total freight traffic in these two ports is foreign in origin or destination. Baltimore is basically an importing port. The major commodities (on a weight basis) coming into Baltimore are iron, copper, aluminum, manganese, and other non-ferrous ores and concentrates, iron products, petroleum and petroleum products, limestone, lumber, sugar, salt, motor vehicles and motor vehicle parts, and equipment. Baltimore leads the Nation in the importing of automobiles and ranks second in iron ore and concentrates. Hampton Roads, on the

TABLE 3-28  
EMPLOYMENT IN THE TRANSPORTATION, COMMUNICATIONS  
AND PUBLIC UTILITIES SECTOR BY SUBREGION, 1970

Subregion	Railroads and Railway Express Services	Trucking Services	Other Trans- portation	Communi- cation	Utilities and Sanitary Services	Total

Source: U. S. Census of Population: 1970, General Social and Economic Characteristics

other hand, is an export-oriented port. Well over half (65 percent) of the total freight tonnage passing through the port of Hampton Roads in 1970 was coal and lignite to be exported. Hampton Roads leads the Nation in this category. The port's location in relation to the coal-rich Central Appalachians gives the port a locational advantage over the other East Coast ports in the coal exporting business. Hampton Roads also conducts important trade in the exporting of corn, wheat, soybeans, tobacco leaf, and grain mill products.

The individual activities in the physical operation of a port such as Baltimore or Hampton Roads takes relatively few people. However, there are many support activities. Workers are needed to load and unload goods and passengers, dredge the channels, supply tugboat and towing services, perform salvaging operations, repair and maintain piers and docks, and perform a host of other activities.

The real impact of water transportation on the Estuary Area's economy is the industry which it attracts to the Region. Three different types of industries are attracted to the Area by the Bay's excellent port facilities. The first is the industries which locate at deepwater sites because of their need for raw materials which are most inexpensively transported by water. Examples of such firms in the Bay Region are Bethlehem Steel, American Smelting and Refining, American Cement, and many of the chemical firms which are located along the waterfront. The second group of industries locates near the water primarily to obtain deepwater access for the shipment of final products. The Western Electric Company ships many electric goods, particularly cable, through the Port of Baltimore. The last group of industries locates near the water because of the nature of their product. Shipbuilding activities in the Hampton Roads area is a good example of this type of industry. As an example of the economic importance of the Bay Region's port facilities, the Maryland Port Authority estimated in 1968 that the activities of the Port of Baltimore provided jobs, directly or indirectly, for more than half of the people working in the State of Maryland.

Although Baltimore and Hampton Roads contain the only major international deepwater ports in the Estuary Area, there is a good deal of barge traffic in the harbors of less important ports in the Bay Region. These ports include Washington, D.C. (including Alexandria, Virginia), Richmond, Hopewell, and Petersburg, Virginia, along with Piney Point, Annapolis, Salisbury, and Cambridge, Maryland. The major commodities shipped through these ports are petroleum and petroleum products, construction materials, and seafood.

### Appendix 3

There are many well-publicized conflicts between water quality in the Chesapeake Bay Region and the Area's water-transportation requirements. The ever increasing size of today's oceangoing ships (up to 60,000 tons with 40-foot drafts in the Bay) has made it necessary to deepen the Bay's ship channels to accommodate these vessels. However, the environmental effects of dredging and spoil disposal operations are not always clear and controversy often arises. For example, a proposed deepening of the James River channel to 35 feet from its present depth of 25 feet (only about 10 percent of the world's oceangoing vessels can navigate a 25 foot channel) was held-up until the effects of the dredging on the large oyster beds in the James could be determined. A hydraulic model of the James River was built to determine the environmental impact. The dredging of the Baltimore Harbor has also been held-up for several years because of problems with spoil disposal. The material dredged from the Baltimore Harbor is laden with heavy metals, noxious chemicals, and sewage. Consequently, the disposal site must be carefully selected to keep environmental damage and aesthetic degradation to a minimum.

Still another conflict between environmental considerations and channel maintenance and improvement operations occurred at the Chesapeake and Delaware Canal project. Since the Delaware Bay is slightly lower than the Chesapeake, large quantities of freshwater from the Susquehanna are diverted through the Canal and into the Delaware River system. The deepening of the Canal from 27 to 35 feet has tremendously increased (by over 2 times) the outflow of freshwater from the Chesapeake causing salinity changes throughout the Bay system and possibly damaging oysters, clams, and other kinds of wildlife which are sensitive to changes in salinity.

In addition to the problems mentioned above, ship discharges of oil, garbage, sewage, and other wastes into the Bay are a growing problem. In 1970 approximately 1.5 million gallons of oil were spilled into the Bay in numerous separate incidents. The untreated sewage dumped into the Bay by both commercial and pleasure vessels is equal to the waste from a city of 20,000 people. With the advent of the supertanker and the environmental and navigation problems associated with their use, the conflicts between advocates of environmental quality and those of economic efficiency are sure to intensify. Hydraulic models such as the one planned as part of the Chesapeake Bay Study can do a large part in resolving these problems.

A good land-based transportation system based on rail and truck service is an integral part of every major port. Such a system enables raw materials from the hinterland, such as coal and grain, to be transported into the major ports for

export overseas. Goods coming into the Region by water, such as foreign automobiles, are transported by rail and truck to all parts of the country.

Over a half of the employment in the Transportation Sector is accounted for by the Railroad and Trucking industries. Unfortunately, there is little data available on types of commodities shipped by rail or truck between production areas. We can only make some broad generalizations about the relative importance of the Railroad and Trucking industries in the Bay Region from the data that is available.

In addition to port-related activities, manufacturers throughout the Bay Region use rail and truck services to transport raw materials and finished goods. Of the approximately 12.0 million tons of goods shipped by firms in the Baltimore SMSA in 1967, about 63 percent were transported by trucks and about 34 percent by rail. Trucking is also very important on the Eastern Shore where fruits, vegetables, and poultry grown in the area are trucked to processing centers on the Eastern and Western Shores.

There has historically been a great deal of interdependence between these three basic modes of transportation. These relationships are emphasized by the trend toward containerization in the major world ports. Containers are truck-sized shipping boxes which, once packed and sealed, can be mounted directly on a truck chassis or a railroad flatcar for fast and efficient handling to and from a seaport terminal. Specially designed cranes can load a container ship in less than eight hours; it takes men five or six days to load an ordinary cargo ship.

Both Baltimore and Hampton Roads are making large investments in facilities which will handle container traffic. The two ports are competing for the second position (behind New York City) in container traffic on the East Coast. If one or both of these Bay ports can capture a large share of the container traffic, all phases of the transportation industry in the Estuary Area will be stimulated.

Transportation by air is also an important activity in the Bay Region. The industrial and commercial prominence of Baltimore and the political importance of Washington, D.C., help to create a high demand for this form of travel. There are two major international airports in the Baltimore-Washington area, Baltimore-Washington International Airport in Baltimore and Dulles International Airport just west of Washington. The major national airlines also serve Wilmington, Salisbury, Norfolk, Newport News, and Richmond. In addition, the relatively flat terrain of the Estuary Area makes possible the existence of numerous small municipal airports throughout the Area.

The telephone industry employs the majority of the workers in the Communications category although numerous television and radio stations also employ significant numbers of workers. The number of telephone calls per capita are often used to help measure the social and economic development of a region. The Estuary Area has a high rating in both of these indexes. The Washington Subregion has an unusually large number of workers in this industry due to the city's function as the Nation's capitol and as an international news center. All the major National radio and television broadcasting companies have offices in the Washington area.

The Public Utilities industry has obvious importance in the water resource planning process. Water-related activities in this category include its preparation for drinking, its use for the disposal and treatment of sewage, and its use for cooling purposes by power generating plants. The discharge of ever increasing volumes of both municipally and industrially treated sewage has received much attention over the years and, in fact, is expected to continue to cause some problems in the more populated areas of the Bay in the near future. Thermal pollution, however, has been receiving more and more attention over recent years, especially in relation to electric power generation. Since about 65 percent of the energy consumed in generating electricity is rejected at the plant site, the water used for cooling is returned to the Bay system at a higher temperature than the surrounding waters. It is still not clear what effects this heating will have on the ecology of the Estuary. The Chesapeake Bay is fortunate in that about one-third of the electricity used in the Bay Region is generated in the Appalachian coal fields and transported into the major urban areas by cable. As a result, the Bay does not have to handle what might be called its "fair share" of thermal discharge.

Nuclear power plants compound the thermal pollution problem since they discharge up to 50 percent more waste heat for each unit of electricity produced. Nuclear technology also creates strong incentives to build larger plants with higher demands for cooling water. For example, the Calvert Cliffs plant in Calvert County, Maryland uses and returns 5,000 cubic feet of heated water/second (cfs) compared to an annual average inflow of about 40,000 cfs for the Susquehanna River (the Bay's largest tributary in terms of inflow), approximately 14,000 cfs for the Potomac, and a total of about 4,000 cfs for all the rivers on the Eastern Shore of Maryland.

There are presently two nuclear power plants in the construction stage in the Estuary Area. These include the Calvert Cliffs plant operated by the Baltimore Gas and Electric Company in Calvert County, Maryland, and the Virginia Electric

and Power Company's North Anna facility located on the North Anna River about 24 miles from Fredericksburg, Virginia. The first nuclear steam plant in the Chesapeake Bay market was completed in 1972 and is located in Surry, Virginia. This plant, which has a capacity of 848 megawatts, is operated by the Virginia Electric and Power Company.

### SERVICES

The Service Sector includes establishments primarily engaged in rendering a wide variety of services to individuals and business establishments. Specifically, such services include:

- a. Hotels, roominghouses, camps, and other lodging places (SIC 70);
- b. Personal services (SIC 72);
- c. Business services (SIC 73);
- d. Automotive repair services, and garages (SIC 75);
- e. Miscellaneous repair services (SIC 76);
- f. Motion pictures (SIC 78);
- g. Amusement and recreation services, except motion pictures (SIC 79);
- h. Health services (SIC 80);
- i. Legal services (SIC 81);
- j. Educational services (SIC 82);
- k. Social services (SIC 83);
- l. Museums, art galleries, botanical, and zoological gardens (SIC 84);
- m. Membership organizations (SIC 86);
- n. Private households (SIC 88);
- o. Miscellaneous services (SIC 89).

In 1970, the Service Sector provided 859,332 jobs for workers in the Estuary Area, the highest of any Sector. This accounted for approximately 26 percent of the total work force and represented an increase of 53 percent over the number employed in 1960. On the National level, services made up 25 percent of the total U.S. employment. In addition, National employment in Services increased by a smaller percentage (38 percent) between 1960-1970 than did employment in the Chesapeake Bay Region.

There is a definite correlation between the size and income of a population and the number and kinds of services demanded. Although only a relatively small percentage of a population may demand a certain service, this small percentage can become a significant market in large concentrations of people. There are literally hundreds of examples of these kinds of services including golf courses, bowling alleys, theaters, automobile rentals, and museums. Higher income groups may demand more recreational facilities, medical, legal, and educational services, as well as certain domestic services. Again, a list of the types of services which could develop in high income areas would be extremely long and varied. In addition, such factors as types of commercial activities and proximity to recreational areas and tourist attractions can also determine the proportion of a region's work force engaged in service activities.

The Chesapeake Bay's land and water resources allow for the development of certain "regionally-unique" entertainment and recreation services which help to expand the Service Sector in the Estuary Area. These include such things as bathing beaches, pleasure boat rentals, party fishing boats, and the operation of beach and yacht clubs. These types of activities can be considered basic in many local economies in the Bay Region.

As Table 3-29 illustrates, educational, health, and professional services were the largest single employers in the Service Sector. Educational services alone accounted for about 28 percent of total Sector employment. Health and professional services accounted for 19 and 13 percents, respectively, of the total Service workers.

The Washington, D.C. Subregion contains almost half (46 percent) of the total Service workers in the Estuary Area although only about 38 percent of the Area's population resided there. The influence of a large Federal government sector in the Capital area is evident in the types of services which are predominant in the Subregion. About 60 percent of the Bay Region's employees in the professional services and approximately 46 percent in the Area's miscellaneous services (including business and research services) are in the Washington Subregion. The location in the National Capital area of the headquarters of many non-profit organizations is reflected in the large numbers of workers in the non-profit organizations category.

Both the Washington and Baltimore Subregions also have large numbers of workers employed in health and educational services. The University of Maryland is the largest university in the Estuary Area with over 30,000 students. Johns Hopkins

Source: U. S. Bureau of the Census, Census of Population: 1970, General Social and Economic Characteristics

University, George Washington University, American University, Howard University, the University of Baltimore, and the United States Naval Academy are also important centers of higher education in the Bay Region.

Johns Hopkins University, Georgetown University, and the University of Maryland carry on important medical research programs. In addition, the National Institute of Health and several other Federal agencies are also engaged in medical research in the Washington area. There are also numerous military hospitals employing significant numbers of medical personnel scattered throughout the Bay Region (see the Armed Forces Sector in this chapter for a listing of these hospitals).

The miscellaneous services category employed the highest proportion of Service workers in the Richmond Subregion. These activities (especially business services) are attracted to the area because of the location of the State Capital in Richmond. In addition, 23 percent of the Service workers in this Subregion are involved in health services. The Richmond Veterans Administration Hospital is a major employer in this category.

The Service Sector comprises only 20.1 percent of the total employment in the Norfolk-Portsmouth Subregion. This figure is significantly less than the figure of 26.1 percent for the total Estuary Area. This is, in part, an indication of the effects of income on the development of the Service Sector of a region. As pointed out in Chapter III of this appendix, the per capita income of the Norfolk-Portsmouth Subregion is by far the lowest of any Subregion in the Estuary Area. The area's figure of \$3,084 per person in 1969 amounted to about 16 percent less than the figure for the Estuary Area as a whole. In addition, a large Armed Forces population in a region will usually result in a proportionately smaller Service Sector since many services are supplied to the military personnel right on base.

Activities in the Service Sector have little impact on the water resources of the Bay Region and will not be discussed in any more detail. However, since more than one of every four workers in the Bay Region is engaged in a Service activity, almost any water resource project will have some effects (directly or indirectly) on the Service Sector. These effects should be taken into account during any evaluation of a project.

## FINANCE, INSURANCE, AND REAL ESTATE

This Sector includes banking, credit agencies, security and commodity brokers, dealers, exchanges, and services (SIC codes 60, 61, and 62) along with insurance (SIC 63 and 64), real estate (SIC 65) and other financial activities (SIC 66 and 67).

There were 157,974 people employed in the Finance, Insurance, and Real Estate Sector in 1970. This amounted to 4.8 percent of the total Estuary Area work force, slightly lower than the National figure of 4.9 percent. Employment in the Sector grew at a rate (47.8 percent) which was considerably higher than the National rate.

There are two basic sources of employment in the Finance category of this Sector in the Estuary Area. The first source includes such "normal" activities as work in savings banks, trust companies, credit agencies, security brokers, holding companies, and other types of investment companies. These activities obviously depend on the availability of money and are consequently attracted to the higher income areas in the Bay Region.

There is a surprising lack of large commercial banks in the Bay Region considering the relatively high levels of income and population density. In fact, of the fifty largest commercial banks (in terms of total assets) in the United States, none are headquartered in the Estuary Area. A major reason for this situation is that many of the large corporations in the area are owned and operated by interests outside the Bay Region. As a result, many of the earnings of these firms are deposited in banks in other regions.

Another major source of employment in this Sector is the National and international financial activities which take place in the Washington, D.C. area. The city serves as the headquarters for the United States Treasury, the Department of Housing and Urban Development with its numerous agencies dealing with mortgages and loans, the Federal Housing Administration, and the Small Business Administration. In addition, there are several international development organizations also located in the area such as the World Bank, the International Monetary Fund, and the Agency for International Development. Since important decisions affecting the entire National financial community often originate in Washington, most of the Nation's major banks have offices in the Capital area. Richmond also

has significant numbers of workers employed in these types of activities due to the City's function as a center of operations for one of the Nation's 12 Federal Reserve Districts.

In addition, the city of Baltimore has developed an important business designed to handle the international banking services required by a major port dealing in foreign trade. All of the major banks in the Baltimore area have international branches. However, financial interests in New York City still control a large part of the international financial activities transacted in the Bay Region.

The insurance industry is also an important employer in the Estuary Area. Washington, D.C. contains the headquarters for the many Federal agencies involved in insurance programs administered by the Federal government. The Federal Home Loan Bank Board, the Federal Deposit Insurance Corporation, and others play major roles in the functioning of the National money market. In addition, two of the 50 largest life insurance companies (Life Insurance of Virginia in Richmond and Acacia Mutual in Washington) are headquartered in the Estuary Area. The City of Richmond, Virginia, acts as a regional center for the insurance industry, serving large parts of the South Atlantic region.

The real estate industry also thrives in high-income, high-population growth areas such as the Estuary Area. There were over 584,000 new housing units built in the Bay Region during the 1960-1970 period. An important part of this activity involved the construction and sale of vacation homes, townhouses, and condominiums throughout the Bay Region but especially along the Western Shore and the Atlantic coast. In many cases, real estate developers have filled in valuable wetlands and carried on environmentally damaging dredging operations in an effort to increase the price of their waterfront properties. Recent laws passed by Maryland and Virginia attempt to control the destruction of wetlands by developers and other commercial or industrial interests.

Since the actual activities of the Finance, Insurance, and Real Estate Sector have no direct impact on the water resources of the Bay Region, this Sector will not be discussed in any more detail.

## SUMMARY

The Manufacturing Sector is probably the most important Sector in the Estuary Area with respect to the water resource planning process. Navigation channels in the Chesapeake Bay are used by many Area Manufacturers as a means of shipping raw materials to their factories or final products to market. In addition, many Manufacturing firms use water in their production process, usually for cleaning or cooling purposes. This water is periodically returned to the Bay system either untreated or only partially treated. The Estuary Area is fortunate, from a water quality standpoint, that its economy has a relatively low level of Manufacturing activity when compared to the Nation or the coastal Northeastern States. Only 15.9 percent of the total number of workers in the Estuary Area were engaged in Manufacturing in 1970. The National figure is 25.3 percent. In addition, the Manufacturing industries which do exist in the Bay Region do not have high rates of water-usage. Of the five major water-using industries in the United States, only the Chemical industry and the Food industry have a higher proportion of workers employed in the Bay Region than in the United States as a whole.

Problems related to oil spills and the discharge of untreated industrial wastes can and have developed in certain areas of the Bay where Manufacturing activity is concentrated. Most of the Manufacturing activity is concentrated in the Baltimore and Wilmington Subregions. Sector employment is located in the Baltimore or Wilmington SMSA's. Other concentrations are located in the Washington and Richmond SMSA's and in the Hampton Roads area. Employment in the Chemical and Metal industries is centered around Baltimore, Wilmington, and Richmond. Food and Kindred Products employment is concentrated on the Eastern Shore, in the Washington SMSA, and in Norfolk. Other significant concentrations of Manufacturing within the Estuary Area are: Printing and Publishing and the two Machinery categories in the Washington Subregion, Transportation Equipment in the Norfolk-Portsmouth Subregion, and Chemicals, and Tobacco processing in the Richmond Subregion.

The Public Administration Sector ranks fourth in total employment in the Estuary Area. However, for several reasons this industry is far more important to the Region's economy than these employment figures indicate. First, high, steady paychecks in this Sector help to stimulate other Sectors of the economy. Second, the Federal portion of the Public

Administration Sector can be thought of as "basic" since it exports its "products" (public services) to the entire Nation.

In 1970, Public Administration accounted for about 14 percent of the total employment in the Estuary Area as compared to a National figure of approximately 6 percent. Almost 66 percent of the workers in the Sector are located in the Washington, D.C. Subregion. Other concentrations of workers are located in the Richmond, Virginia, vicinity, throughout much of the Baltimore, Maryland SMSA, and in the major urban areas of the Norfolk-Portsmouth Subregion. Three state capitals (Annapolis, Richmond, and Dover) are located in the Estuary Area.

The Agriculture, Forestry, and Fisheries Sector employed a surprisingly low percentage (1.6 percent) of the total workers in the Estuary Area. Most of these workers (68 percent) were engaged in Agriculture. Poultry and Poultry Products sold provided the greatest income for the Area, followed by Dairy Products and Vegetables which ranked second and third respectively. Wicomico and Worcester Counties, Maryland, and Sussex County, Delaware, had the highest value of Agricultural products sold.

Even though the Agricultural Sector is not of any great significance in terms of numbers employed, it has a great deal of impact on the water resource planning process. Poor farming techniques have resulted in extensive erosion and siltation of many of the Bay's waterways. Runoff from fields which have been sprayed with chemical fertilizers add large amounts of nutrients to the waterways. This can cause a tremendous build-up in the amounts of algae and other vegetation in the water thereby decreasing the amounts of oxygen and possibly causing fish kills. In addition, the indiscriminant use of insecticides annually causes tremendous damage to fish and wildlife (as well as human) populations in the Estuary Area.

The Construction Sector was provided an important stimulus during the 1960-1970 period by the tremendous influx of new people into the Bay Region. There was a net increase of over one-half million housing units in the Region during this time. As might be expected, housing construction activity in the Estuary Area was generally concentrated in those counties which experienced the highest gains in population. The Washington Subregion alone accounted for about 53 percent of the total increase in housing units. The Baltimore Subregion accounted for an additional 23 percent.

Increases in business and commercial activities in the Estuary Area helped to create a boom in the construction of new office

buildings during the Sixties. The construction of the Estuary Area's portion of the Interstate Highway System and the improvement of many other highways, roads, and bridges also provided a significant number of jobs during the decade.

Construction activities have a great deal of impact on the water resources of the Bay Region. Much of the disturbed soil on construction sites erodes and becomes sediment in streams and rivers. This silt can damage fish and wildlife populations, clog navigation channels, increase the costs of treatment for city and industrial water supplies, make water recreation less enjoyable, and generally lower the aesthetic quality of a waterway. In addition, the indiscriminant cutting of trees, paving of land, and the destruction of wetlands during construction activities greatly increases the runoff from a given rainfall which, in turn, increases the frequency and severity of floods. Unfortunately, the areas in the Bay Region with the most construction activity are the same areas in which there are already significant industrial and residential strains on the Bay's resources.

The Mining Sector is another category which has important implications for the water resources planning process although there were relatively few workers employed in this Sector. Most of the commodities mined in the Bay Region are used as building materials for local construction projects. As a result, the demand for these materials (sand, gravel, stone, and clay) has increased right along with the tremendous increases in construction activity throughout the Bay Region. A major part of the sand and gravel produced in the Bay Region is extracted from river bottoms by dredging operations. These operations can cause damage to finfish and shellfish populations due to the clouding and silting of waterways in the area of the dredging. The operation of quarries, the major method of extracting stone and clay in the Bay Region, can also cause environmental problems associated with erosion, acid mine drainage, and aesthetics.

Wholesale and Retail Trade activities employed just over 17 percent of the total workers in the Estuary Area. About 81 percent of these workers were engaged in Retail Trade. The relatively high incomes prevailing in the Bay Region are a major reason for the well-developed Retail Trade industry. The existence of modern highway systems around the major cities along with the movement of many higher-income families out of the city has led to the establishment of large shopping centers in the suburban counties. These counties have captured an increasing share of the retail sales in the Bay Region during the last several decades. The Washington, D.C., and Baltimore, Maryland, SMSA's contain the bulk (about 65 percent)

of the retail trade business in the Region with about \$7.6 billion and \$4.7 billion worth of sales in 1972. Other important retail centers are located in Richmond City, Wilmington, and in the Hampton Roads area of Virginia.

Wholesale trade in an area will often revolve around goods (manufactured or agricultural) which are produced in that area. For example, Baltimore specializes in the wholesaling of metal and metal products, Wilmington in drugs and chemicals, and Richmond in raw farm products (including tobacco auctioning and warehousing). Since the producing Sectors of the Estuary Area's economy are relatively small, the wholesale trade industry is not particularly well-developed in the Bay Region. The major SMSA's of the Study Area control the bulk of the wholesale business with about 94 percent of the total 1972 wholesale sales in the Bay Region.

The approximately quarter of a million Armed Forces personnel stationed in the Bay Region in 1970 represented almost 8 percent of the total Estuary Area employment. This percentage was significantly higher than the National figure of approximately 2.6 percent. There are several reasons for the large numbers of military personnel in the Region. First, military bases tend to be concentrated in the vicinity of the National Capital as a defense against invasion. Second, the Chesapeake Bay and its tributaries provide well-protected, deepwater harbors suitable for naval bases and related naval operations. Approximately 44 percent of all the Armed Forces personnel in the Bay Region are stationed in the Norfolk-Portsmouth Sub-region.

Slightly over six percent of the Region's work force was employed in the Transportation, Communications, and Public Utilities Sector. The economic development of the Estuary Area has been largely based on the natural transportation network provided by the Chesapeake Bay and its tributaries. A total of about 150 million short tons of cargo was shipped on the Chesapeake Bay during 1970. Most of this freight (81.8 percent) passed through the ports of Baltimore (51 million short tons) or Hampton Roads (71 million short tons). Hampton Roads leads the Nation in the exporting of coal and lignite. Baltimore leads the country in the importing of automobiles and ranks second in iron ore and concentrates. The most important impact of water transportation on the Estuary Area's economy is the industry which it attracts to the Region. The Maryland Port Authority estimated that the activities of the Port of Baltimore provided jobs, directly or indirectly, for more than half of the people working in the State of Maryland.

The ever increasing size of today's oceangoing ships make it necessary to deepen the Bay's channels to accommodate these vessels. However, the environmental effects of dredging and spoil disposal operations are not always clear and controversy often arises. A hydraulic model such as the one planned as part of the Chesapeake Bay Study can do a large part in finding solutions to these problems.

In addition to these port-related transportation activities, manufacturers throughout the Bay Region use rail and truck services to transport raw materials and finished goods. Over a half of the employment in the Transportation Sector is accounted for by the Railroad and Trucking industries. Historically there has been a great deal of interdependence between the three basic modes of transportation: rail, truck, and water. These relationships have been emphasized by the trend toward containerization in the major world ports. Both Baltimore and Hampton Roads are making large investments in facilities which will handle container traffic. The two ports are competing for the second position (behind New York City) in container traffic on the East Coast of the United States.

The Public Utilities industry has obvious importance in the water resource planning process. Water-related activities in this category include its preparation for drinking, its use for the disposal and treatment of sewage, and its use for cooling purposes by power generating plants. Overloaded sewage treatment plants can contribute many gallons of pollutants to the Bay system. Thermal pollution, especially in relation to electric power generation, has recently come into the spotlight. It is still not clear what effects this heating will have on the ecology of the Estuary. Nuclear power plants compound the thermal pollution problem since they discharge up to 50 percent more waste heat for each unit of electricity produced. Nuclear technology also creates strong incentives to build large plants with high demands for cooling water. For example, the Calvert Cliffs, Maryland, plant will use and return 5,000 cubic feet of heated water/second to the Bay system, more than the average annual inflow (in cfs) of all the rivers on the Eastern Shore of Maryland. There are presently three nuclear power plants in the construction stage in the Estuary Area with between 10 and 20 additional nuclear plants planned for the Area during the next 20 years.

In 1970, the Service Sector provided more jobs for Bay Region workers than any other Sector. About one of every four workers was employed in some Service activity. Miscellaneous services (e.g., business, repair, research, and private household services), educational services, and health services were the most important categories in terms of employment in the Bay Region.

The Washington, D.C. Subregion contains almost half (46 percent) of the total Service workers in the Estuary Area although only about 38 percent of the Area's population resided there. In addition, about 60 percent of the Bay Region's employees in the professional services and approximately 46 percent in the Area's miscellaneous services are located in the Washington Subregion.

Both the Washington and Baltimore Subregions have large numbers of workers employed in health and educational services. The University of Maryland is the largest university in the Estuary Area with over 30,000 students. Johns Hopkins University, George Washington University, American University, Howard University, the University of Baltimore, and the United States Naval Academy are also important centers of higher education in the Bay Region.

The Norfolk-Portsmouth Subregion has the lowest percentage of workers employed in the Service Sector. This was largely due to the relatively low income levels prevailing in that area and to the large numbers of military personnel in the Subregion. Many of the services demanded by military personnel are supplied "on base" rather than in the local economy.

There are two basic sources of employment in the Finance category of the Finance, Insurance, and Real Estate Sector. The first source includes such "normal" activities as work in savings banks, trust companies, credit agencies, security brokerages, holding companies, and other types of investment companies. These activities obviously depend on the availability of money and are consequently attracted to the higher-income areas of the Bay Region. A second major source of employment in this category is the National and international financial activities centered in the Washington, D.C. area. Since important decisions affecting the entire National financial community often originate in Washington, most of the Nation's major banks have offices in the Capital area.

The insurance industry is also an important employer in the Estuary Area. Washington, D.C. contains the headquarters for the many Federal agencies involved in insurance programs administered by the Federal government. The City of Richmond, Virginia, acts as a regional center for the insurance industry, serving large parts of the South Atlantic region.

The Real Estate industry thrives in high-income, high population growth areas such as the Estuary Area. An important part of the Real Estate activity in the Region involved the sale of vacation homes, townhouses, and condominiums throughout the Bay Region but especially along the Western Shore and the Atlantic Coast.

## CHAPTER V

### ECONOMIC AND DEMOGRAPHIC PROJECTIONS

In making economic and demographic projections for the Chesapeake Bay Study Area, a program of economic measurement, analysis, and projection conducted by the Bureau of Economic Analysis (BEA) - formerly the Office of Business Economics (OBE) - of the U. S. Department of Commerce, and the Economic Research Service (ERS) of the U. S. Department of Agriculture was used. The OBERS program, as it has come to be called, deals with the economic activity of the entire Nation and seeks to provide a regional economic information system covering both the past and the future. The OBERS historical and projected data form a National economic framework within which a region's present and future levels of economic development can be assessed and compared with those of other regions.

In 1967, the Bureau of the Census developed four sets of projections, Series A, B, C, and D, which assumed varying fertility rates. By December 1972, the Census Bureau had abandoned the Series A and B projections and had added Series E and F. At the time the Existing Conditions Report was developed, the Water Resources Council (WRC) required that all Federal agencies involved in water resources planning use the OBERS Series C projections of population, income, employment, earnings, and output. These projections are presented in a multi-volume series of reports entitled the 1972 OBERS Projections - Regional Economic Activity in the U. S. Starting in 1974, however, WRC directed that agencies involved in water resource planning use the Series E projections (generally, the E Series assumes lower fertility rates as well as less defense spending than the C Series). These Series E projections, published in a seven-volume series in April 1974, were derived from more recent economic and demographic data. Both Series of reports served as basic analytical frameworks for the assessment of the economic implications of proposed water and

related land resource development activities in the United States.

In this chapter, both the Series C and the Series E OBERS projections are presented for the Chesapeake Bay Study Area. The Series C projections are considered to be the baseline or reference set of projections for this report since the majority of the resource projections were made for the Future Conditions Report prior to the adoption of the Series E projections by the WRC. The Series E projections will be presented in a sensitivity analysis to provide alternative rates and patterns of growth to the baseline or reference Series C projections. A comparison of the assumptions made in each set of projections will also be provided. In addition, the two sets of projections will be compared in terms of "population" and "total employment" for the Estuary Area.

#### METHODOLOGY USED IN DEVELOPING OBERS PROJECTIONS

##### THE NATIONAL FRAMEWORK

The OBERS projection procedure calls first for projections of National totals of such things as Gross National Product (GNP) or employment. These totals are then disaggregated into National industry components such as the value of GNP originating in the "food and kindred products" industry. The National industry components are then distributed regionally in accordance with projected trends in the regional distributions of economic activities. Conceivably, the economy of each region could have been projected independently. However, the alternative course of first making National projections as a guide or control on the regional projections is followed because National trends as well as National inter-industry relationships, are generally more stable and measurable, and hence, projections have more reliability than those for smaller areas. This is another way of saying that National measurements can be more accurately made than can regional ones. The initial step in preparing the National projections was to project the

GNP to 2020. GNP is the product of projected annual employment, man-hours worked per year, and production per man-hour (generally referred to as "product per man-hour"). (For a more detailed discussion, see "State Projections of Income, Employment and Population," Survey of Current Business, April 1971).

National employment totals were derived from the Census Bureau's published projections of the population by applying to them estimated labor force participation ratios and unemployment rates derived from past trends in these variables. Hours worked per year and product per man-hour were also projected on the basis of the trends in these two variables since 1948.

Total GNP was disaggregated into the gross product originating (GPO) in each of 37 National industries. The GPO is the value of the GNP originating in a particular industry such as the "primary metal industries." This disaggregation represented an extension of trends in the industrial composition of the economy over the past two decades. National totals of aggregate personal income and earnings of persons engaged in each industry and employment by industry were derived from past relationships and from separate analyses of the industrial composition of earnings and employment.

#### THE ECONOMIC AREA FRAMEWORK

Inasmuch as the preparation of projections requires a knowledge and extension of past relationships, the more precisely such relationships can be identified and measured, the more accurate the projections will be. Although for water and related land resources planning economic projections are needed on a water resources subarea basis, such geographic areas are not satisfactory units for use in preparing projections. Accordingly, projections were made first for some 173 nodal-functional economic areas and then converted to the water resources subareas. These economic areas (known as BEA economic areas) are presented in Figure 3-21.

From a geographic point of view, an economic area encompasses a principal trade and labor market center together with the surrounding county units whose economic activity is focused on the center. An area includes, as closely as possible, both the place of work and the place of residence of its workers. This characteristic allows the regional economic analyst wide scope inasmuch as he may, at one and the same time, view an area's workers in both their producing and consuming roles.

From an industrial point of view, an area's economy may be viewed in terms of a group of "basic" industries and a related group of "residential" industries. Basic industries are those which play the central role in an area's development. In the production of its basic industries, an area has special economic advantages relative to other areas. Thus, much of its basic-industry output tends to be exported to other areas in return for outputs in which its product mix is deficient. In every area, the basic group includes agriculture; mining; all manufacturing, except food and kindred products; printing and publishing; and armed forces. Residential industries tend to spring from basic industries. Their origin may be viewed as a response to requirements for special services on the part of both basic-industry firms (e.g., transportation and wholesaling), and basic-industry workers in their role as consumers (e.g., recreation and retailing). It is important to note that the interdependence of an area's basic and residential industries is integral to the BEA economic area projection process. The residential group in every area typically includes contract construction, transportation, communications, utilities, trade, finance, business and professional services, and civilian government activities. However, in areas where one or more of these typically residential activities serve larger than regional markets, they are treated as basic activities.

The initial step in the economic area (as distinct from the National) projection process was the calculation of the shares of earnings and employment in each basic industry received by residents of each of the 173 areas of the Nation for nine selected years from 1929 to 1968. Changes in the shares accruing to each region were analyzed industry-by-industry. Mathematical extensions of these trends were calculated and then modified in accordance with information from other sources. Projected shares of earnings and employment for selected years in each region were applied to the National totals in the appropriate industry to obtain projected earnings in dollar terms and employment in numbers of persons.

Earnings and employment in nonbasic or residential industries were then allocated to the 173 regions in accordance with projections of the trend in past relationships of basic and residential industries. Income projections were developed from the projections of total earnings. Population was then projected on the basis of projected employment and income.

The economy of the Estuary Area is best understood in the light of the relationship to the various BEA economic areas within which it is contained. Consequently, they are the primary areas which will be used for the analysis of the economic effects of water resources development and management programs for the Chesapeake Bay area.

### COMPARISON OF OBERS SERIES C AND SERIES E PROJECTIONS

There are a number of basic differences between the Series C and Series E projections as shown in Table 3-30. Such differences must be understood in order to use the two sets of projections effectively in water resource planning.

The National personal income, earnings, and employment data for Series C are presented in Tables 3-31 and 3-32. For comparative purposes, those same data for Series E are presented in Tables 3-33 and 3-34.

The Series C OBERS projections and the methodology used in developing them are presented below. This will be followed by a presentation of Series E OBERS projections and their related methodology. The final portion of the chapter will consist of the comparison of the two sets of projections with regard to population and total employment within the Estuary Area.

### ECONOMIC AND DEMOGRAPHIC PROJECTIONS USING SERIES C OBERS PROJECTIONS

#### THE CHESAPEAKE BAY SUBSEGMENTS

In order for the Chesapeake Bay Study to meet the planners' needs, it was necessary to disaggregate the baseline or Series C projections for the analytical economic area unit. This was accomplished by the Regional Economic Division, Bureau of Economic Analysis, U. S. Department of Commerce. Projections were made for standard metropolitan statistical areas (SMSA's) and for both non-SMSA Estuary and non-SMSA non-Estuary subsegments (outside Study Area) of the economic areas. Putting the SMSA and these subsegment projections into a form accessible to Chesapeake Bay Study planners

TABLE 3-30

## A COMPARISON OF OBER'S SERIES C AND SERIES E PROJECTIONS

<u>Item</u>	<u>Series C</u>	<u>Series E</u>
Growth of Population	Fertility rate of 2,800 children per 1,000 women	Gradual decline of fertility rate from 2,800 to the "replacement fertility rate" of 2,100 children per 1,000 women.
Military Establishment	Projects a decline to 2.07 million people by 1975 and thereafter a constant.	Projects a decline to 1.57 million persons by 1975 and thereafter a constant (due to smaller military establishment and the resultant smaller need for equipment and supplies, a significantly slow rate of growth in the defense-related manufacturing industries is anticipated).
Hours Worked Per Year	Hours worked per employee per year are projected to decline at 0.25 percent per year.	Hours worked per employee per year are projected to decline at 0.35 percent per year.
Product Per Man-Hour	Projected to increase 3.0 percent per year.	Projected to increase 2.9 percent per year.
Earnings Per Worker	Earnings per worker in the individual industries at the national level are projected to converge toward the combined rate for all industries more slowly in the Series E projections than in the Series C projections.	
Employed Population	Projected to increase from 40 to 41 percent of the total population.	Projected to be between 43 and 45 percent of the total population (higher percentages with the E Series reflects expected higher participation rates by women).

\*Employment is for 1960.  
\*\*Alaska and Hawaii excluded.

required several steps. One step involved aggregating the projections for two or more single-State non-SMSA subsegments into projections for the appropriate non-SMSA Estuary or non-SMSA non-Estuary subsegments. Another step required further disaggregations of the projections for given single-State non-SMSA subsegments in order to divide those subsegments into their Estuary and non-Estuary parts. These further disaggregations were accomplished by holding constant into the future the average of the 1967 and 1968 percent shares of the various income, employment, and population series for the given single-State non-SMSA subsegments accounted for by the geographic parts of those subsegments. A constant rather than a trended percent share methodology was employed because the geographic parts were too small for meaningful trends to be established.

In short, projections for the Chesapeake Bay subsegments were derived as the result of a process of successive disaggregation and reaggregation of the BEA economic area projections in increasingly greater geographic detail. Care was taken to assure that every data series for every geographic configuration within the system was additive to the corresponding data series at the next higher level of geographic detail.

The area of primary concern in the Chesapeake Bay Study, for projection purposes, has been defined as the counties or SMSA's which touch or have a major influence on the Estuary. As indicated in Figure 3-1, the Estuary Area encompasses seven SMSA's, 35 non-SMSA counties, and four independent cities.

Six BEA economic areas--Philadelphia (15), Harrisburg (16), Baltimore (17), Washington (18), Richmond (21), and Norfolk-Portsmouth (22)--are of particular interest to Chesapeake Bay Study planners. Each of these areas has been subdivided into constituent SMSA, non-SMSA Estuary, and non-SMSA residual (or non-Estuary subsegments). Projections include population, total personal income, earnings and employment for 36 industry categories. Historical trends and projections (using the C Series) as well as a county breakdown for each subsegment, are presented in Tables 3-37 to 3-112. Preceding these in Tables 3-35 and 3-36 are trends and projections for the Chesapeake Bay Estuary Area as a whole.

DATA MAY NOT ADD TO HIGHER LEVEL TOTALS BECAUSE OF ROUNDING  
(S) TOO SMALL TO BE PROJECTED

## THE PHILADELPHIA ECONOMIC AREA

The Philadelphia, Pennsylvania-New Jersey Economic Area (15) comprises seven SMSA subsegments and one non-SMSA non-Estuary subsegment. Only one of the SMSA subsegments - Wilmington, Delaware-New Jersey-Maryland - is in the Estuary Area. The county compositions of the eight Philadelphia subsegments are shown in Table 3-37 as well as in Figure 3-22. Economic and demographic projections for the economic area as a whole and for its eight subsegments, together with the historical data upon which the projections are based, are presented in Tables 3-38 to 3-55.

## THE HARRISBURG ECONOMIC AREA

The Harrisburg, Pennsylvania Economic Area (16) consists of four SMSA subsegments and one non-SMSA non-Estuary subsegment. Although none of the subsegments is in the Estuary Area, Harrisburg is still of interest to Chesapeake Bay planners because many of its residents recreate in the Estuary Area. The county compositions of the five Harrisburg subsegments are shown in Table 3-56 as well as in Figure 3-23. Economic and demographic projections for the economic area as a whole and for its five subsegments, together with the historical data upon which the projections are based, are presented in Tables 3-57 to 3-68. In addition to permit reconciliation with State planning regions, projections of population and total personal income for Franklin and Lebanon Counties are shown in Table 3-68.

## THE BALTIMORE ECONOMIC AREA

The Baltimore, Maryland Economic Area (17) consists of one SMSA Estuary subsegment, three non-SMSA Estuary subsegments, and one non-SMSA non-Estuary subsegment. The county compositions of the five Baltimore subsegments are shown in Table 3-69 as well as in Figure 3-24. Economic and demographic projections for the economic area as a whole and for its five subsegments, together with the historical data upon which the projections are based, are presented in Tables 3-70 to 3-81.

## THE WASHINGTON ECONOMIC AREA

The Washington, D.C.-Maryland-Virginia Economic Area (18) consists of one SMSA Estuary subsegment, two non-SMSA Estuary subsegments, and one non-SMSA non-Estuary subsegment. The county compositions of the four Washington subsegments are shown in Table 3-82 as well as Figure 3-25. Economic and demographic projections for the economic area as a whole and for its four subsegments, together with the historical data upon which the projections are based, are presented in Tables 3-83 to 3-92.

## THE RICHMOND ECONOMIC AREA

The Richmond, Virginia Economic Area (21) consists of the combined Richmond, Virginia, and Petersburg-Colonial Heights, Virginia, SMSA's, located in the Estuary Area, as well as one non-SMSA Estuary subsegment and one non-SMSA non-Estuary subsegment. The county compositions of the three Richmond subsegments are shown in Table 3-93 and Figure 3-26. Economic and demographic projections for the economic area as a whole and for its three subsegments, together with the historical data upon which the projections are based, are presented in Tables 3-94 to 3-101. In addition to permit reconciliation with State planning regions, projections of population and total personal income for Greensville, Goochland, Powhatan, and Sussex Counties are also shown in Table 3-101.

## THE NORFOLK-PORTSMOUTH ECONOMIC AREA

The Norfolk-Portsmouth, Virginia Economic Area (22) consists of two SMSA Estuary subsegments, one non-SMSA Estuary subsegment and one non-SMSA non-Estuary subsegment. The county compositions of the four Norfolk-Portsmouth subsegments are shown in Table 3-102 and in Figure 3-27. Economic and demographic projections for the economic area as a whole and for its four subsegments, together with the historical data upon which the projections are based, are presented in Tables 3-103 to 3-112.

SUB-SEGMENT AND COUNTY BREAKDOWN FOR  
ECONOMIC AREA 21C - RICHMOND, VA.

21-1	<u>Richmond, Va. and Petersburg,-Colonial Heights, Va. SMSA's (Combined)*</u>	21-3	<u>Residual Non-SMSA Area***</u>
	Chesterfield		Albemarle and Charlottesville, Virginia
	Hanover		Amelia, Virginia
	Henrico and Richmond City		Brunswick, Virginia
	Colonial Heights**		Buckingham, Virginia
	Dinwiddie and Petersburg		Cumberland, Virginia
	Prince George and Hopewell		Fluvanna, Virginia
			Goochland, Virginia
			Greene, Virginia
			Greensville, Virginia
21-2	<u>Non-SMSA Area, Virginia*</u>		Louisa, Virginia
	Caroline		Lunenburg, Virginia
	Charles City		Madison, Virginia
	Essex		Mecklenburg, Virginia
	King and Queen		Nottoway, Virginia
	King William		Orange, Virginia
	Lancaster		Powhatan, Virginia
	New Kent		Prince Edward, Virginia
	Northumberland		Sussex, Virginia
	Richmond		
	Westmoreland		

\*Included in Estuary Area as defined.

\*\*Colonial Heights currently included in Chesterfield County.

\*\*\*In addition, projections of population and total personal income will be made for the following group of counties to permit reconciliation with State Planning Districts:

Greensville, Virginia  
Goochland, Virginia  
Powhatan, Virginia  
Sussex, Virginia

## ECONOMIC AND DEMOGRAPHIC PROJECTIONS USING SERIES E OBERS PROJECTIONS

The methodology employed in developing the E Series was much the same as that used for Series C. The major differences in the two have already been stated. The Series E projections are provided here for the identical BEA economic areas and SMSA's as those projected with Series C, with the exception that the Richmond and Petersburg-Colonial Heights SMSA's are projected separately. Due to both monetary and time limitations, however, and the fact that the E Series were not the baseline or reference set of projections used in the Future Conditions Report, there were no projections made by BEA for non-SMSA areas or residential non-SMSA areas (non-Estuary areas), as BEA had done with the Series C projections. In addition, BEA's selected projected years for Series E were slightly different from those used in the C Series. Series E projections are presented for the following years: 1950, 1962, 1969, 1970, 1971, 1980, 1985, 1990, 2000, and 2020.

The Series E projections for economic areas and SMSA's are presented in Tables 3-113 through 3-141. Projections for each economic area are introduced by a list (in table form) of SMSA and non-SMSA counties and independent cities within that particular economic area.

## COMPARISON OF SERIES C AND SERIES E OBERS PROJECTIONS

As was pointed out earlier in the chapter, certain differences exist between Series C and Series E economic and demographic projections. In order to compare the two series, "population" and "total employment" projections are presented in Tables 3-142 and 3-143 for: (1) the six BEA Economic Areas within which the Estuary Area is included and, (2) the Estuary Area portion of each of these Economic Areas. (There is no portion of Economic Area 16 within the Estuary Area; therefore, it is excluded from Table 3-143).

\*All figures rounded off to nearest hundred.

Generally, population is projected to increase at a lower rate with the E Series during the period 1980 to 2020. However, as illustrated below, differences in growth rates between Economic Areas exist with both Series C and Series E projections. The generally lower growth rates associated with the E projections are attributed to lower fertility rates as forecast by BEA. Even with lower growth rates, population is expected to increase in each of the six Economic Areas as well as the Estuary Area itself during the projected period.

Series E projections of "total employment" also show an increase but at a lower rate than those of Series C. This can be attributed to a number of factors. First, a smaller military establishment has been assumed in the E Series. As a consequence, a significantly slower rate of growth in the defense-related manufacturing industries is projected. Second, the lower populations projected in the E Series indicates a smaller potential labor force. Oddly enough, increases in total employment are greater in the E projections initially than with the C Series. This is due to lower fertility rates which enable more women to enter the labor force.

Changes in population rates of growth are not necessarily paralleled by changes in total employment. For example, an Economic Area may experience an increase in population of 15 percent between 1980 and 2000, yet its total employment for that period may increase by 19 percent. This can be explained in a number of ways: greater female participation in the labor force and/or fewer hours worked per year per man as anticipated during the projection period.

The E Series projects that approximately 4.0 percent of the U.S. population or 8,875,900 people will be living in the Estuary Area by 1980. This is 4.3 percent less people than forecast by Series C. By the year 2000, the population is projected to increase to 11,574,300; and in 2020, it will have surpassed 14,127,000 people or 4.8 percent of the U.S. population. Thus, the Estuary Area's growth rate will be slightly greater than the National rate. Table 3-143 shows the E population projection for 2020 to be over 13 percent less than the population projected by the C Series.

Total employment for the Estuary Area is forecast to be higher using the E Series through the year 2000. However, by 2020 Series E projects 4.8 percent fewer people employed within the Estuary Area than does the C Series. In 1980, total employment will reach 4,061,200 people as projected by Series E. This will represent 45.9 percent of the total population. By 2020, the number employed will make up 46.0 percent of the

total population within the Study Area. Thus, very little change is expected in the ratio of population to total employment. For the United States as a whole, the percentage of population employed (14 years of age & older) will be 43 percent in 1980 and 43.9 percent in 2020. This represents a ratio lower than that for the Estuary Area.

The percent difference between Series E and Series C increases with each selected projected year--again with the exception of the Washington, D.C.-Maryland-Virginia economic area. In addition, of the five economic areas in which the Estuary Area is included, only the Washington, D.C.-Maryland-Virginia economic area has a higher population growth rate with Series E projections than with Series C. By 2020, however, Series E projects 1.0 percent fewer people than the C Series. This is most likely due to the fact that Washington, D.C., is the center of the Federal Government. As government continues to expand, the region will continue to attract people. All of the other economic areas follow the National trend with lower rates of growth projected by Series E. The greatest differences in population growth rates are found in the Baltimore, Maryland, economic area where there are 28.6 percent fewer people projected in the E Series by 2020.

Comparing the two projection Series in terms of "total employment," a number of economic areas experience greater rates of growth with the E projections than with the C for selected projected years 1980 and 2000. By 2020, however, only the Washington, D.C.-Maryland-Virginia economic area experiences greater total employment with the E Series. As with population rates, this is due to the attraction of the Federal Government as a chief employer in the Region.

## CHAPTER VI

### SUMMARY

Historically, the land and water resources of the Chesapeake Bay Area have strongly influenced the development and economy of the Region. In colonial times, agriculture, forestry, and fisheries provided food and building materials for a growing Nation. Large amounts of freshwater have been available for both municipal and industrial use, and the Bay and its tributaries have served as valuable waterways for commerce. In addition, recreational resources and the natural beauty offered by the Bay and its sub-estuaries have traditionally offered strong inducement to live in the area.

Today, portions of the Chesapeake Bay Region are heavily urbanized. The Region itself forms the southern portion of "megapolis", a twentieth century phenomena considered by many to be the economic center of the Nation. The population of the Region, which has doubled since 1940, is currently about 8 million. It is expected to double again by 2020 with over 50 percent of this future growth projected to take place in the Washington, D. C. Subregion.

In terms of employment, almost 3.3 million people were employed in the Bay Area in 1970. This is projected to increase to over 6.8 million by 2020. The majority of those presently employed work in the Services, Wholesale, and Retail Trade; Manufacturing; and Public Administration Sectors. Other Sectors such as Mining; Agriculture, Forestry, and Fisheries; Construction; Transportation, Communications, and Utilities; Finance, Insurance, and Real Estate; and the Armed Forces are also important as sources of employment within the Study Area.

Although less than ten percent of the land is used for residential, commercial, and industrial uses, nearly 80 percent of

the people in the Bay Area live in urban areas. The intensive socio-economic development which has characterized the Bay Region has brought with it certain conflicts between man and nature: ever increasing demands by industry for water for processing and cooling; recreational facilities and opportunities lagging behind a booming demand; adverse impacts brought about by expansion of navigational facilities to keep pace with economic expansion; continued pollution and sedimentation of the Region's waterways as a result of construction, industrial effluents, storm runoff, and municipal discharges; and shortage of adequate water supply and waste treatment facilities in some areas.

Based on both past and present trends and the number of inhabitants projected for the Estuary Area, conflicts between man and the Bay can only be expected to intensify while the demands to be placed on the Bay's resources will increase. The projections presented in this appendix will prove useful for other Chesapeake Bay activity studies and in determining where future pressures on land and water resources can be expected. It is hoped that the appendix will serve as important input to a management program which will be used to guide man in utilizing the resources of the Chesapeake Bay Region.
